TextWorld is a text-based learning environment for Reinforcement Learning agent.

WHAT IS TEXTWORLD?

TextWorld is a sandbox learning environment for training and testing reinforcement learning (RL) agents on text-based games. It enables generating games from a game distribution parameterized by the map size, the number of objects, quest length and complexity, richness of text descriptions, and more. Then, one can sample game from that distribution. TextWorld can also be used to play existing text-based games.

**CHAPTER
TWO**

KNOWN ISSUES

2.1 Inform 7

Inform 7 command line tools don't support Windows Linux Subsystem (a.k.a Bash on Ubuntu on Windows).

CHAPTER THREE

TW-PLAY

Play a TextWorld game (.z8 or .ulx).

```
usage: tw-play [-h] [--mode MODE] [--max-steps STEPS] [--viewer [PORT]] [-v]
                [-vv]
                game
```

3.1 Positional Arguments

game

3.2 Named Arguments

--mode	Possible choices: random, human, random-cmd, walkthrough
	Select an agent to play the game: ['random', 'human', 'random-cmd', 'walkthrough']. Default: "human".
	Default: "human"
--max-steps	Limit maximum number of steps.
	Default: 0
--viewer	Start web viewer.
-v, --verbose	Verbose mode.
	Default: False
-vv, --very-verbose	Print debug information.
	Default: False

CHAPTER
FOUR

TW-MAKE

```
usage: tw-make [-h] [--third-party PATH]
               {custom,tw-coin_collector,tw-treasure_hunter,tw-simple,tw-cooking}
               ...
```

4.1 Named Arguments

--third-party Load an external python file. Useful to register custom challenges on-the-fly.

4.2 Types of game to create

subcommand Possible choices: custom, tw-coin_collector, tw-treasure_hunter, tw-simple, tw-cooking

4.3 Sub-commands:

4.3.1 custom

Make a custom game.

```
tw-make custom [-h] [--world-size SIZE] [--nb-objects NB] [--theme THEME]
              [--include-adj] [--blend-descriptions]
              [--ambiguous-instructions] [--only-last-action]
              [--blend-instructions] [--entity-numbering]
              [--nb-parallel-quests NB_PARALLEL_QUESTS]
              [--quest-length LENGTH] [--quest-breadth BREADTH]
              [--quest-min-length LENGTH] [--quest-max-length LENGTH]
              [--quest-min-breadth BREADTH] [--quest-max-breadth BREADTH]
              [--quest-min-depth DEPTH] [--quest-max-depth DEPTH]
              [--output PATH] [--seed SEED] [--format {ulx,z8}] [--overview]
              [--save-overview] [-f] [--silent | -v]
```

Custom game settings

--world-size	Nb. of rooms in the world. Default: 5
--nb-objects	Minimum nb. of objects in the world. Default: 10

Grammar settings

--theme	Theme to use for generating the text. Default: “house” Default: “house”
--include-adj	Turn on adjectives. Default: False
--blend-descriptions	Blend descriptions across consecutive sentences. Default: False
--ambiguous-instructions	Refer to an object using its type (e.g. red container vs. red chest). Default: False
--only-last-action	Instruction only describes the last action of quest. Default: False
--blend-instructions	Blend instructions across consecutive actions. Default: False
--entity-numbering	Append a number after an entity name if there is not enough variation for it (e.g. ‘red apple 2’). Default: False

Quest settings

--nb-parallel-quests	Nb. of parallel quests the game will have. Default: 1. Default: 1
--quest-length	Nb. of actions the quest requires to be completed. It is a shorthand for ‘–quest-min-length N –quest-max-length N –quest-max-depth N’.
--quest-breadth	Nb. of subquests the quests will have. It is a shorthand for ‘–quest-min-breadth N –quest-max-breadth N’.

Quest settings (advanced)

--quest-min-length	Minimum nb. of actions the quest requires to be completed. This setting is ignored if --quest-length is provided. Default: 1. Default: 1
--quest-max-length	Maximum nb. of actions the quest requires to be completed. This setting is ignored if --quest-length is provided. Default: 5. Default: 5
--quest-min-breadth	Minimum nb. of subquests the quests can have. This setting is ignored if --quest-breadth is provided. Default: 1. Default: 1
--quest-max-breadth	Maxmimum nb. of subquests the quests can have. This setting is ignored if --quest-breadth is provided. Default: 5. Default: 5
--quest-min-depth	Minimum nb. of actions the subquests can have. Default: 1. Default: 1
--quest-max-depth	Maximum nb. of actions the subquests can have. This setting is ignored if --quest-length is provided. Default: 5. Default: 5

General settings

--output	Path where to save the generated game. If it points to a folder, the game's UUID will be used as the filename. Default: "./tw_games/"
--seed	
--format	Possible choices: ulx, z8 Which format to use when compiling the game. Default: "z8" Default: "z8"
--overview	Display an overview of the generated game. Default: False
--save-overview	Save the overview image of the generated game alongside the game as a PNG file. Default: False
-f, --force	Default: False
--silent	Default: False
-v, --verbose	Default: False

4.3.2 tw-coin_collector

Generate a Coin Collector game

```
tw-make tw-coin_collector [-h] --level LEVEL [--output PATH] [--seed SEED]
                           [--format {ulx,z8}] [--overview] [--save-overview]
                           [-f] [--silent | -v]
```

Coin Collector game settings

--level The difficulty level. Must be between 1 and 300 (included).

General settings

--output Path where to save the generated game. If it points to a folder, the game's UUID will be used as the filename.
Default: "./tw_games/"

--seed

--format Possible choices: ulx, z8
Which format to use when compiling the game. Default: "z8"
Default: "z8"

--overview Display an overview of the generated game.
Default: False

--save-overview Save the overview image of the generated game alongside the game as a PNG file.
Default: False

-f, --force Default: False

--silent Default: False

-v, --verbose Default: False

4.3.3 tw-treasure_hunter

Generate a Treasure Hunter game

```
tw-make tw-treasure_hunter [-h] --level LEVEL [--output PATH] [--seed SEED]
                           [--format {ulx,z8}] [--overview] [--save-overview]
                           [-f] [--silent | -v]
```

Treasure Hunter game settings

--level The difficulty level. Must be between 1 and 30 (included).

General settings

--output	Path where to save the generated game. If it points to a folder, the game's UUID will be used as the filename.
	Default: "./tw_games/"
--seed	
--format	Possible choices: ulx, z8 Which format to use when compiling the game. Default: "z8" Default: "z8"
--overview	Display an overview of the generated game. Default: False
--save-overview	Save the overview image of the generated game alongside the game as a PNG file. Default: False
-f, --force	Default: False
--silent	Default: False
-v, --verbose	Default: False

4.3.4 tw-simple

Generate simple challenge game

```
tw-make tw-simple [-h] --rewards {dense,balanced,sparse} --goal
                  {detailed,brief,none} [--test] [--output PATH] [--seed SEED]
                  [--format {ulx,z8}] [--overview] [--save-overview] [-f]
                  [--silent | -v]
```

Simple game settings

--rewards	Possible choices: dense, balanced, sparse The reward frequency: dense, balanced, or sparse.
--goal	Possible choices: detailed, brief, none The description of the game's objective shown at the beginning of the game: detailed, brief, or none
--test	Whether this game should be drawn from the test distributions of games. Default: False

General settings

--output	Path where to save the generated game. If it points to a folder, the game's UUID will be used as the filename. Default: "./tw_games/"
--seed	
--format	Possible choices: ulx, z8 Which format to use when compiling the game. Default: "z8" Default: "z8"
--overview	Display an overview of the generated game. Default: False
--save-overview	Save the overview image of the generated game alongside the game as a PNG file. Default: False
-f, --force	Default: False
--silent	Default: False
-v, --verbose	Default: False

4.3.5 tw-cooking

Generate cooking games similar to those used for the First TextWorld Problem (FTWP) competition (<https://aka.ms/ftwp>).

```
tw-make tw-cooking [-h] [--recipe INT] [--take INT] [--go {1,6,9,12}] [--open]
                   [--cook] [--cut] [--drop] [--recipe-seed INT]
                   [--split {train,valid,test}] [--output PATH] [--seed SEED]
                   [--format {ulx,z8}] [--overview] [--save-overview] [-f]
                   [--silent | -v]
```

First TextWorld Competition game settings

--recipe	Number of ingredients in the recipe. Default: 1 Default: 1
--take	Number of ingredients to find. It must be less or equal to the value of --recipe. Default: 0 Default: 0
--go	Possible choices: 1, 6, 9, 12 Number of locations in the game (1, 6, 9, or 12). Default: 1 Default: 1
--open	Whether containers/doors need to be opened. Default: False

--cook	Whether some ingredients need to be cooked. Default: False
--cut	Whether some ingredients need to be cut. Default: False
--drop	Whether the player's inventory has limited capacity. Default: False
--recipe-seed	Random seed used for generating the recipe. Default: 0 Default: 0
--split	Possible choices: train, valid, test Control which foods can be used. Can either be ‘train’, ‘valid’, or ‘test’. Default: foods from all dataset splits can be used.

General settings

--output	Path where to save the generated game. If it points to a folder, the game's UUID will be used as the filename. Default: “./tw_games/”
--seed	
--format	Possible choices: ulx, z8 Which format to use when compiling the game. Default: “z8” Default: “z8”
--overview	Display an overview of the generated game. Default: False
--save-overview	Save the overview image of the generated game alongside the game as a PNG file. Default: False
-f, --force	Default: False
--silent	Default: False
-v, --verbose	Default: False

TW-VIEW

Display the graph representation of a game's initial state.

```
usage: tw-view [-h] [-v] game
```

5.1 Positional Arguments

game JSON file containing infos about the game.

5.2 Named Arguments

-v, --verbose Verbose mode.

Default: False

CHAPTER
SIX

TW-EXTRACT

Extract information from a list of TextWorld games.

```
usage: tw-extract [-h] [-f] [--merge] [-q | -v]
                   {vocab,entities,walkthroughs,commands} ...
```

6.1 Positional Arguments

subcommand Possible choices: vocab, entities, walkthroughs, commands
Type of information to extract.

6.2 Named Arguments

-q, --quiet Default: False
-v, --verbose Default: False

6.3 General settings

-f, --force Default: False
--merge Merge extracted information to existing output file.
Default: False

6.4 Sub-commands:

6.4.1 vocab

Extract vocabulary.

```
tw-extract vocab [-h] [-f] [--merge] [-q | -v] [--output OUTPUT]
                  [--theme THEME]
                  [game [game ...]]
```

Positional Arguments

game	List of TextWorld games (.ulx .z8 .json).
-------------	---

Named Arguments

-q, --quiet	Default: False
-v, --verbose	Default: False
--output	Output file containing all words (.txt). Default: “vocab.txt” Default: “vocab.txt”
--theme	Provide a text grammar theme from which to extract words.

General settings

-f, --force	Default: False
--merge	Merge extracted information to existing output file. Default: False

6.4.2 entities

Extract entity names.

```
tw-extract entities [-h] [-f] [--merge] [-q | -v] [--output OUTPUT]
                     game [game ...]
```

Positional Arguments

game	List of TextWorld games (.ulx .z8 .json).
-------------	---

Named Arguments

-q, --quiet	Default: False
-v, --verbose	Default: False
--output	Output file containing all entity names (.txt). Default: “entities.txt” Default: “entities.txt”

General settings

-f, --force	Default: False
--merge	Merge extracted information to existing output file. Default: False

6.4.3 walkthroughs

Extract walkthroughs.

```
tw-extract walkthroughs [-h] [-f] [--merge] [-q | -v] [--output OUTPUT]
                        game [game ...]
```

Positional Arguments

game	List of TextWorld games (.ulx .json).
-------------	---------------------------------------

Named Arguments

-q, --quiet	Default: False
-v, --verbose	Default: False
--output	Output file containing all walkthroughs (.txt). Default: “walkthroughs.txt” Default: “walkthroughs.txt”

General settings

-f, --force	Default: False
--merge	Merge extracted information to existing output file. Default: False

6.4.4 commands

Extract all possible commands.

```
tw-extract commands [-h] [-f] [--merge] [-q | -v] [--output OUTPUT]
                     game [game ...]
```

Positional Arguments

game	List of TextWorld games (.ulx .json).
-------------	---------------------------------------

Named Arguments

-q, --quiet	Default: False
-v, --verbose	Default: False
--output	Output file containing all commands (.txt). Default: “commands.txt” Default: “commands.txt”

General settings

-f, --force	Default: False
--merge	Merge extracted information to existing output file. Default: False

TEXTWORLD

7.1 Core

exception `textworld.core.EnvInfoMissingError(requester, info)`

Bases: `NameError`

Thrown whenever some environment information EnvInfos.

exception `textworld.core.GameNotRunningError(msg='')`

Bases: `RuntimeError`

Error when game is not running (either has terminated or crashed).

class `textworld.core.Agent`

Bases: `object`

Interface for any agent that want to play a text-based game.

act(`game_state, reward, done`)

Acts upon the current game state.

Parameters

- **game_state** (`GameState`) – Current game state.
- **reward** (`float`) – Accumulated reward up until now.
- **done** (`bool`) – Whether the game is finished.

Return type `str`

Returns Text command to be performed in this current state.

finish(`game_state, reward, done`)

Let the agent know the game has finished.

Parameters

- **game_state** (`GameState`) – Game state at the moment the game finished.
- **reward** (`float`) – Accumulated reward up until now.
- **done** (`bool`) – Whether the game has finished normally or not. If False, it means the agent's used up all of its actions.

Return type `None`

reset(`env`)

Let the agent set some environment's flags.

Parameters `env` (`Environment`) – TextWorld environment.

Return type None

property wrappers

class `textworld.core.EnvInfos(**kwargs)`
Bases: `object`

Customizing what information will be returned by an environment.

Information can be requested by setting one or more attributes to True. The attribute `extras` should be a list of strings corresponding to keys in the metadata dictionary of TextWorld generated games.

copy()

admissible_commands
Type bool
All commands relevant to the current state. This information changes from one step to another.

basics: `Iterable[str]`
Information requested excluding the extras.

Return type `Iterable[str]`

command_templates
Templates for commands understood by the game. This information *doesn't* change from one step to another.
Type bool

description
Text description of the current room, i.e. output of the `look` command. This information changes from one step to another.
Type bool

entities
Names of all entities in the game. This information *doesn't* change from one step to another.
Type bool

extras
Names of extra information which are game specific.
Type `List[str]`

facts
All the facts that are currently true about the world. This information changes from one step to another.
Type bool

feedback
Text observation produced by the game in response to previous command. This information changes from one step to another.
Type bool

game
Current game in its serialized form. Use with `textworld.Game.deserialize`.
Type bool

intermediate_reward
Reward (proxy) indicating if the player is making progress. This information changes from one step to another.

Type bool

inventory

Text listing of the player's inventory, i.e. output of the `inventory` command. This information changes from one step to another.

Type bool

last_action

The last action performed where None means it was not a valid action. This information changes from one step to another.

Type bool

last_command

The last command performed where None means it was not a valid command. This information changes from one step to another.

Type bool

location

Name of the player's current location. This information changes from one step to another.

Type bool

lost

Whether the player lost the game. This information changes from one step to another.

Type bool

max_score

Maximum reachable score of the game. This information *doesn't* change from one step to another.

Type bool

moves

Number of moves done so far in the game. This information changes from one step to another.

Type bool

objective

Objective of the game described in text. This information *doesn't* change from one step to another.

Type bool

policy_commands

Sequence of commands leading to a winning state. This information changes from one step to another.

Type bool

score

Current score of the game. This information changes from one step to another.

Type bool

verbs

Verbs understood by the the game. This information *doesn't* change from one step to another.

Type bool

won

Whether the player won the game. This information changes from one step to another.

Type bool

```
class textworld.core.Environment(infos=None)
```

Bases: object

Class allowing to interact with the game's interpreter.

The role of an *Environment* is to handle the communication between user code and the backend interpreter that manages the text-based game. The overall *Environment* structure is highly inspired by OpenAI's gym.

Example

Here's a minimal example of how to interact with an *Environment*

```
>>> import textworld
>>> options = textworld.GameOptions()
>>> options.seeds = 1234
>>> options.nb_objects = 5
>>> options.quest_length = 2
>>> game_file, _ = textworld.make(options, path='./') # Generate a random game.
>>> env = textworld.start(game_file) # Load the game.
>>> game_state = env.reset() # Start a new game.
>>> env.render()
```

I hope you're ready to go into rooms and interact with objects, because you've just entered TextWorld! Here is how to play! First thing I need you to do is to ensure that the type G chest is open. And then, pick up the keycard from the type G chest inside the attic. Got that? Good!

```
-= Attic =-
```

You arrive in an attic. A normal kind of place. You begin to take stock of what's in the room.

You make out a type G chest. You can see a TextWorld style locker. The TextWorld style locker contains a frisbee and a sock.

There is a TextWorld style key on the floor.

```
>>> command = "take key" # Command to send to the game.
>>> game_state, reward, done = env.step(command)
>>> env.render()
```

(the TextWorld style key)

You pick up the TextWorld style key from the ground.

Parameters `infos` (Optional[*EnvInfos*]) – Information to be included in the game state. By default, only the game's narrative is included.

close()

Ends the game.

Return type None

copy()

Return a copy of this environment at the same state.

Return type *Environment*

Returns A copy of this environment at the same state.

load(*path*)
Loads a new text-based game.

Parameters `path` (str) – Path to the game file to load.

Return type None

render(*mode='human'*)
Renders the current state of the game.

Parameters `mode` (str) – The mode to use for rendering.

Return type Optional[str]

reset()
Starts game from the beginning.

Return type GameState

Returns Initial state of the game.

seed(*seed=None*)
Sets the seed for the random number generator.

Return type None

step(*command*)
Performs a given command.

Parameters `command` (str) – Text command to send to the interpreter.

Return type Tuple[GameState, float, bool]

Returns A tuple containing the new game state, a reward for performing that command and reaching this new state, and whether the game is finished or not.

property display_command_during_render: bool
Enables/disables displaying the command when rendering.

Return type bool

class textworld.core.GameState
Bases: dict

copy()
Returns a deepcopy of this game state.

Return type GameState

class textworld.core.Wrapper(*env=None*)
Bases: object

Special environment that wraps others to provide new functionalities.

Special environment that wraps other `Environment` objects to provide new functionalities (e.g. transcript recording, viewer, etc).

Parameters `env` (Optional[`Environment`]) – environment to wrap.

close()

Return type None

copy()

Return type *Wrapper*

load(*path*)

Return type None

render(*mode='human'*)

Return type Optional[Any]

reset()

Return type GameState

seed(*seed=None*)

Return type List[int]

step(*command*)

Return type Tuple[GameState, float, bool]

property display_command_during_render: bool

Return type bool

property unwrapped

TEXTWORLD.GYM

```
textworld.gym.utils.register_game(gamefile, request_infos=None, batch_size=None, auto_reset=False,  
                                  max_episode_steps=50, asynchronous=True, action_space=None,  
                                  observation_space=None, name='', **kwargs)
```

Make an environment for a particular game.

Parameters

- **gamefile** (str) – Path for the TextWorld game (*.ulx|*.z[1-8]).
- **request_infos** (Optional[[EnvInfos](#)]) – For customizing the information returned by this environment (see [textworld.EnvInfos](#) for the list of available information).

Warning: Only supported for TextWorld games (i.e., with a corresponding *.json file).

- **batch_size** (Optional[int]) – If provided, it indicates the number of games to play at the same time. By default, a single game is played at once.

Warning: When batch_size is provided (even for batch_size=1), `env.step` expects a list of commands as input and outputs a list of states. `env.reset` also outputs a list of states.

- **auto_reset** (bool) – If True, each game *independently* resets once it is done (i.e., reset happens on the next `env.step` call). Otherwise, once a game is done, subsequent calls to `env.step` won't have any effects.
- **max_episode_steps** (int) – Number of steps allocated to play each game. Once exhausted, the game is done.
- **asynchronous** (bool) – If True, games in the batch are played in parallel. Only when batch size is greater than one.
- **action_space** (Optional[Space]) – The action space be used with OpenAI baselines. (see [textworld.gym.spaces.Word](#)).
- **observation_space** (Optional[Space]) – The observation space be used with OpenAI baselines (see [textworld.gym.spaces.Word](#)).
- **name** (str) – Name for the new environment, i.e. “tw-{name}-v0”. By default, the returned env_id is “tw-v0”.

Return type str

Returns The corresponding gym-compatible env_id to use.

Example

```
>>> from textworld.generator import make_game, compile_game
>>> options = textworld.GameOptions()
>>> options.seeds = 1234
>>> game = make_game(options)
>>> game.extras["more"] = "This is extra information."
>>> gamefile = compile_game(game)

>>> import gym
>>> import textworld.gym
>>> from textworld import EnvInfos
>>> request_infos = EnvInfos(description=True, inventory=True, extras=["more"])
>>> env_id = textworld.gym.register_game(gamefile, request_infos)
>>> env = gym.make(env_id)
>>> ob, infos = env.reset()
>>> print(infos["extra.more"])
This is extra information.
```

`textworld.gym.utils.register_games(gamefiles, request_infos=None, batch_size=None, auto_reset=False, max_episode_steps=50, asynchronous=True, action_space=None, observation_space=None, name='', **kwargs)`

Make an environment that will cycle through a list of games.

Parameters

- **gamefiles** (List[str]) – Paths for the TextWorld games (*.ulx|*.z[1-8]).
- **request_infos** (Optional[[EnvInfos](#)]) – For customizing the information returned by this environment (see `textworld.EnvInfos` for the list of available information).

Warning: Only supported for TextWorld games (i.e., with a corresponding *.json file).

- **batch_size** (Optional[int]) – If provided, it indicates the number of games to play at the same time. By default, a single game is played at once.

Warning: When `batch_size` is provided (even for `batch_size=1`), `env.step` expects a list of commands as input and outputs a list of states. `env.reset` also outputs a list of states.

- **auto_reset** (bool) – If True, each game *independently* resets once it is done (i.e., reset happens on the next `env.step` call). Otherwise, once a game is done, subsequent calls to `env.step` won't have any effects.
- **max_episode_steps** (int) – Number of steps allocated to play each game. Once exhausted, the game is done.
- **asynchronous** (bool) – If True, games in the batch are played in parallel. Only when batch size is greater than one.

- **action_space** (Optional[Space]) – The action space be used with OpenAI baselines. (see `textworld.gym.spaces.Word`).
- **observation_space** (Optional[Space]) – The observation space be used with OpenAI baselines (see `textworld.gym.spaces.Word`).
- **name** (str) – Name for the new environment, i.e. “tw-{ name }-v0”. By default, the returned env_id is “tw-v0”.

Return type str

Returns The corresponding gym-compatible env_id to use.

Example

```
>>> from textworld.generator import make_game, compile_game
>>> options = textworld.GameOptions()
>>> options.seeds = 1234
>>> game = make_game(options)
>>> game.extras["more"] = "This is extra information."
>>> gamefile = compile_game(game)

>>> import gym
>>> import textworld.gym
>>> from textworld import EnvInfos
>>> request_infos = EnvInfos(description=True, inventory=True, extras=["more"])
>>> env_id = textworld.gym.register_games([gamefile], request_infos)
>>> env = gym.make(env_id)
>>> ob, infos = env.reset()
>>> print(infos["extra.more"])
This is extra information.
```

8.1 Agent

```
class textworld.gym.core.Agent
Bases: object
```

Interface for any agent playing TextWorld games.

act(obs, score, done, infos)

Acts upon the current list of observations.

One text command must be returned for each observation.

Parameters

- **obs** (str) – Previous command’s feedback (game’s narrative).
- **score** (int) – The score obtained so far.
- **done** (bool) – Whether the game is finished.
- **infos** (Mapping[str, Any]) – Additional information requested.

Return type str

Returns Text command to be performed. If episode has ended (i.e. done is True), the returned value is expected to be ignored.

property infos_to_request: `textworld.core.EnvInfos`

Returns what additional information should be made available at each game step.

Requested information will be included within the `infos` dictionary passed to `Agent.act()`. To request specific information, create a `textworld.EnvInfos` and set its attributes to True accordingly.

In addition to the standard information, certain games may have specific information that can be requested via the `extras` attribute. Refer to the documentation specific to the game to know more (see `textworld.challenges`).

Example

Here is an example of how to request information and retrieve it.

```
>>> from textworld import EnvInfos
>>> request_infos = EnvInfos(description=True, inventory=True)
...
>>> env = gym.make(env_id)
>>> ob, infos = env.reset()
>>> print(infos["description"])
>>> print(infos["inventory"])
```

Return type `EnvInfos`

8.2 Envs

```
class textworld.gym.envs.textworld.TextworldGymEnv(gamefiles, request_infos=None,
                                                    max_episode_steps=None, action_space=None,
                                                    observation_space=None, **kwargs)
```

Bases: `textworld.gym.envs.textworld_batch.TextworldBatchGymEnv`

Environment for playing text-based games.

Parameters

- **gamefiles** (List[str]) – Paths of every game composing the pool (*.ulx|*.z[1-8]).
- **request_infos** (Optional[`EnvInfos`]) – For customizing the information returned by this environment (see `textworld.EnvInfos` for the list of available information).

Warning: Only supported for TextWorld games (i.e., that have a corresponding *.json file).

- **max_episode_steps** (Optional[int]) – Number of steps allocated to play each game. Once exhausted, the game is done.
- **action_space** (Optional[Space]) – The action space be used with OpenAI baselines. (see `textworld.gym.spaces.Word`).
- **observation_space** (Optional[Space]) – The observation space be used with OpenAI baselines (see `textworld.gym.spaces.Word`).

`reset()`

Resets the text-based environment.

Resetting this environment means starting the next game in the pool.

Return type Tuple[str, Dict[str, Any]]

Returns

A tuple (observation, info) where

- observation: text observed in the initial state;
- infos: additional information as requested.

step(command)

Runs a command in the text-based environment.

Parameters **command** – Text command to send to the game interpreter.

Return type Tuple[str, Dict[str, Any]]

Returns

A tuple (observation, score, done, info) where

- observation: text observed in the new state;
- score: total number of points accumulated so far;
- done: whether the game is finished or not;
- infos: additional information as requested.

```
metadata = {'render.modes': ['human', 'ansi', 'text']}
```

```
class textworld.gym.envs.textworld_batch.TextworldBatchGymEnv(gamefiles, request_infos=None,
                                                               batch_size=1, asynchronous=True,
                                                               auto_reset=False,
                                                               max_episode_steps=None,
                                                               action_space=None,
                                                               observation_space=None)
```

Bases: gym.core.Env

Environment for playing text-based games in batch.

Parameters

- **gamefiles** (List[str]) – Paths of every game composing the pool (*.ulx|*.z[1-8]|*.json).
- **request_infos** (Optional[EnvInfos]) – For customizing the information returned by this environment (see `textworld.EnvInfos` for the list of available information).

Warning: Only supported for TextWorld games (i.e., that have a corresponding *.json file).

- **batch_size** (int) – If provided, it indicates the number of games to play at the same time. By default, a single game is played at once.

Warning: When `batch_size` is provided (even for `batch_size=1`), `env.step` expects a list of commands as input and outputs a list of states. `env.reset` also outputs a list of states.

- **asynchronous** (bool) – If True, wraps the environments in an `AsyncBatchEnv` (which uses `multiprocessing` to run the environments in parallel). If False, wraps the environments in a `SyncBatchEnv`. Default: True.
- **auto_reset** (bool) – If True, each game *independently* resets once it is done (i.e., reset happens on the next `env.step` call). Otherwise, once a game is done, subsequent calls to `env.step` won't have any effects.
- **max_episode_steps** (Optional[int]) – Number of steps allocated to play each game. Once exhausted, the game is done.
- **action_space** (Optional[Space]) – The action space be used with OpenAI baselines. (see `textworld.gym.spaces.Word`).
- **observation_space** (Optional[Space]) – The observation space be used with OpenAI baselines (see `textworld.gym.spaces.Word`).

close()

Close this environment.

Return type None

render(mode='human')

Renders the current state of each environment in the batch.

Each rendering is composed of the previous text command (if there's one) and the text describing the current observation.

Parameters mode (str) – Controls where and how the text is rendered. Supported modes are:

- human: Display text to the current display or terminal and return nothing.
- ansi: Return a `StringIO` containing a terminal-style text representation. The text can include newlines and ANSI escape sequences (e.g. for colors).
- text: Return a string (str) containing the text without any ANSI escape sequences.

Return type Union[StringIO, str, None]

Returns Depending on the mode, this method returns either nothing, a string, or a `StringIO` object.

reset()

Resets the text-based environment.

Resetting this environment means starting the next game in the pool.

Return type Tuple[List[str], Dict[str, List[Any]]]

Returns

A tuple (observations, infos) where

- observation: text observed in the initial state for each game in the batch;
- infos: additional information as requested for each game in the batch.

seed(seed=None)

Set the seed for this environment's random generator(s).

This environment use a random generator to shuffle the order in which the games are played.

Parameters seed (Optional[int]) – Number that will be used to seed the random generators.

Return type List[int]

Returns All the seeds used to set this environment's random generator(s).

```

skip(nb_games=1)
    Skip games.

    Parameters nb_games (int) – Number of games to skip.

    Return type None

step(commands)
    Runs a command in each text-based environment of the batch.

    Parameters commands – Text command to send to the game interpreter.

    Return type Tuple[List[str], List[float], List[bool], Dict[str, List[Any]]]

    Returns

        A tuple (observations, scores, dones, infos) where
        • observations: text observed in the new state for each game in the batch;
        • scores: total number of points accumulated so far for each game in the batch;
        • dones: whether each game in the batch is finished or not;
        • infos: additional information as requested for each game in the batch.

metadata = {'render.modes': ['human', 'ansi', 'text']}

textworld.gym.envs.utils.shuffled_cycle(iterable, rng, nb_loops=-1)
    Yield each element of iterable one by one, then shuffle the elements and start yielding from the start. Stop after nb_loops loops.

    Parameters

        • iterable (Iterable[Any]) – Iterable containing the elements to yield.
        • rng (RandomState) – Random generator used to shuffle the elements after each loop.
        • nb_loops (int) – Number of times to go through all the elements. If set to -1, loop an infinite number of times.

    Return type Iterable[Any]

```

8.3 Spaces

```

exception textworld.gym.spaces.text_spaces.VocabularyHasDuplicateTokens
    Bases: ValueError

class textworld.gym.spaces.text_spaces.Char(max_length, vocab=None, extra_vocab[])
    Bases: gym.spaces.multi_discrete.MultiDiscrete

    Character observation/action space

    This space consists of a series of gym.spaces.Discrete objects all with the same parameters. Each gym.spaces.Discrete can take integer values between 0 and len(self.vocab).

```

Notes

The following special token will be prepended (if needed) to the vocabulary:

- '#' : Padding token

Parameters

- **max_length** (*int*) – Maximum number of characters in a text.
- **vocab** (*list of char, optional*) – Vocabulary defining this space. It shouldn't contain any duplicate characters. If not provided, the vocabulary will consist in characters [a-z0-9], punctuations [", "-", """] and padding '#'.
- **extra_vocab** (*list of char, optional*) – Additional tokens to add to the vocabulary.

filter_unknown(*text*)

Strip out all characters not in the vocabulary.

tokenize(*text, padding=False*)

Tokenize characters found in the vocabulary.

Note: text will be padded up to `self.max_length`.

class `textworld.gym.spaces.text_spaces.Word(max_length, vocab)`

Bases: `gym.spaces.multi_discrete.MultiDiscrete`

Word observation/action space

This space consists of a series of `gym.spaces.Discrete` objects all with the same parameters. Each `gym.spaces.Discrete` can take integer values between 0 and `len(self.vocab)`.

Notes

The following special tokens will be prepended (if needed) to the vocabulary:

- '<PAD>' : Padding
- '<UNK>' : Unknown word
- '<S>' : Beginning of sentence
- '</S>' : End of sentence

Example

Let's create an action space that can be used with `textworld.gym.register_game`. We are going to assume actions are short phrases up to 8 words long.

```
>>> import textworld
>>> gamefiles = ["/path/to/game.ulx", "/path/to/another/game.z8"]
>>> vocab = textworld.vocab.extract_from(gamefiles)
>>> vocab = sorted(vocab) # Sorting the vocabulary, optional.
>>> action_space = textworld.gym.text_spaces.Word(max_length=8, vocab=vocab)
```

Parameters

- **max_length** (*int*) – Maximum number of words in a text.

- **vocab** (*list of strings*) – Vocabulary defining this space. It shouldn't contain any duplicate words.

tokenize(*text, padding=False*)

Tokenize words found in the vocabulary.

Note: text will be padded up to `self.max_length`.

TEXTWORLD.ENVS

9.1 TextWorld

```
class textworld.envs.tw.TextWorldEnv(infos=None)
Bases: textworld.core.Environment
```

Environment for playing games by TextWorld.

Parameters `infos` (Optional[*EnvInfos*]) – Information to be included in the game state. By default, only the game’s narrative is included.

copy()

Return a copy of this environment.

It is safe to call `step` and `reset` on the copied environment.

Warning: The Game and Inform7Game private objects are *soft* copies.

Return type `TextWorldEnv`

load(*path*)

Loads a new text-based game.

Parameters `path` (str) – Path to the game file to load.

Return type None

reset()

Starts game from the beginning.

Returns Initial state of the game.

step(*command*)

Performs a given command.

Parameters `command` (str) – Text command to send to the interpreter.

Returns A tuple containing the new game state, a reward for performing that command and reaching this new state, and whether the game is finished or not.

9.2 Glulx

```
class textworld.envs.glulx.git_glulx.GitGlulxEnv(*args, **kwargs)
Bases: textworld.core.Environment
```

Environment to support playing Glulx games.

This environment supports playing text-based games that were compiled for the [Glulx virtual machine](#). The main advantage of using Glulx over Z-Machine is it uses 32-bit data and addresses, so it can handle game files up to four gigabytes long. This comes handy when we want to generate large world with a lot of objects in it.

We use a customized version of [git-glulx](#) as the glulx interpreter. That way we don't rely on stdin/stdout to communicate with the interpreter but instead use UNIX sockets.

Parameters `infos` – Information to be included in the game state. By default, only the game's narrative is included.

close()

Ends the game.

Return type None

load(*ulx_file*)

Loads a new text-based game.

Parameters `path` – Path to the game file to load.

Return type None

render(*mode='human'*)

Renders the current state of the game.

Parameters `mode` (str) – The mode to use for rendering.

Return type None

reset()

Starts game from the beginning.

Return type str

Returns Initial state of the game.

step(*command*)

Performs a given command.

Parameters `command` (str) – Text command to send to the interpreter.

Return type str

Returns A tuple containing the new game state, a reward for performing that command and reaching this new state, and whether the game is finished or not.

property game_running: bool

Determines if the game is still running.

Return type bool

9.3 Wrappers

class `textworld.envs.wrappers.recorder.Recorder`
 Bases: `textworld.core.Wrapper`

Parameters `env` – environment to wrap.

reset()

Return type `GameState`

step(*command*)

Return type `Tuple[GameState, float, bool]`

class `textworld.envs.wrappers.viewer.HtmlViewer(env, open_automatically=True, port=8080)`
 Bases: `textworld.core.Wrapper`

Wrap a TextWorld environment to provide visualization.

During a playthrough, the game can be visualized via local webserver `http://localhost:<port>`.

:param : The TextWorld environment to wrap. :type : param env: :param : Port to use for the web viewer. :type : param port:

close()

Close the game.

In addition to shutting down the game, this closes the local webserver.

reset()

Reset the game.

Returns

Return type Initial game state.

step(*command*)

Perform a game step.

Parameters `command` (str) – Text command to send to the game engine.

Return type `Tuple[GameState, float, bool]`

Returns

- `game_state` – Updated game state.
- `score` – Score for reaching this state.
- `done` – Whether the game is done or not.

property port

class `textworld.envs.wrappers.filter.Filter(env=None)`
 Bases: `textworld.core.Wrapper`

Environment wrapper to filter what information is made available.

Requested information will be included within the `infos` dictionary returned by `Filter.reset()` and `Filter.step(...)`. To request specific information, create a `textworld.EnvInfos` and set the appropriate attributes to True. Then, instantiate a `Filter` wrapper with the `EnvInfos` object.

Example

Here is an example of how to request information and retrieve it.

```
>>> from textworld import EnvInfos
>>> from textworld.envs.wrappers import Filter
>>> request_infos = EnvInfos(description=True, inventory=True, extras=["more"])
>>> env = textworld.start(gamefile, request_infos)
>>> env = Filter(env)
>>> ob, infos = env.reset()
>>> print(infos["description"])
>>> print(infos["inventory"])
>>> print(infos["extra.more"])
```

Parameters `env` (Optional[*Environment*]) – environment to wrap.

`copy()`

Return type `Filter`

`reset()`

Return type `Tuple[str, Mapping[str, Any]]`

`step(command)`

Return type `Tuple[str, Mapping[str, Any]]`

9.4 Z-Machine

```
class textworld.envs.zmachine.jericho.JerichoEnv(*args, **kwargs)
Bases: textworld.core.Environment
```

Parameters `infos` – Information to be included in the game state. By default, only the game's narrative is included.

`close()`

Ends the game.

`copy()`

Return a copy of this environment at the same state.

Return type `JerichoEnv`

`load(z_file)`

Loads a new text-based game.

Parameters `path` – Path to the game file to load.

Return type `None`

`reset()`

Starts game from the beginning.

Returns Initial state of the game.

seed(*seed=None*)

Sets the seed for the random number generator.

step(*command*)

Performs a given command.

Parameters **command** – Text command to send to the interpreter.

Returns A tuple containing the new game state, a reward for performing that command and reaching this new state, and whether the game is finished or not.

property game_running: bool

Determines if the game is still running.

Return type bool

TEXTWORLD.AGENTS

```
class textworld.agents.human.HumanAgent(autocomplete=True, walkthrough=True)
Bases: textworld.core.Agent
```

act(game_state, reward, done)

Acts upon the current game state.

Parameters

- **game_state** – Current game state.
- **reward** – Accumulated reward up until now.
- **done** – Whether the game is finished.

Returns Text command to be performed in this current state.

reset(env)

Let the agent set some environment's flags.

Parameters

env – TextWorld environment.

```
class textworld.agents.random.NaiveAgent(seed=1234)
```

Bases: textworld.core.Agent

act(game_state, reward, done)

Acts upon the current game state.

Parameters

- **game_state** – Current game state.
- **reward** – Accumulated reward up until now.
- **done** – Whether the game is finished.

Returns Text command to be performed in this current state.

reset(env)

Let the agent set some environment's flags.

Parameters

env – TextWorld environment.

```
class textworld.agents.random.RandomCommandAgent(seed=1234)
```

Bases: textworld.core.Agent

act(game_state, reward, done)

Acts upon the current game state.

Parameters

- **game_state** – Current game state.

- **reward** – Accumulated reward up until now.
- **done** – Whether the game is finished.

Returns Text command to be performed in this current state.

reset(*env*)

Let the agent set some environment's flags.

Parameters **env** – TextWorld environment.

class `textworld.agents.simple.NaiveAgent`(*seed*=1234)

Bases: `textworld.core.Agent`

act(*game_state*, *reward*, *done*)

Acts upon the current game state.

Parameters

- **game_state** – Current game state.
- **reward** – Accumulated reward up until now.
- **done** – Whether the game is finished.

Returns Text command to be performed in this current state.

reset(*env*)

Let the agent set some environment's flags.

Parameters **env** – TextWorld environment.

exception `textworld.agents.walkthrough.WalkthroughDone`

Bases: NameError

class `textworld.agents.walkthrough.WalkthroughAgent`(*commands*=None)

Bases: `textworld.core.Agent`

Agent that simply follows a list of commands.

act(*game_state*, *reward*, *done*)

Acts upon the current game state.

Parameters

- **game_state** – Current game state.
- **reward** – Accumulated reward up until now.
- **done** – Whether the game is finished.

Returns Text command to be performed in this current state.

reset(*env*)

Let the agent set some environment's flags.

Parameters **env** – TextWorld environment.

TEXTWORLD.GENERATOR

```
exception textworld.generator.GenerationWarning
```

Bases: UserWarning

```
textworld.generator.compile_game(game, options=None)
```

Compile a game.

Parameters

- **game** (*Game*) – Game object to compile.
- **options** (*Optional[GameOptions]*) – For customizing the game generation (see *textworld.GameOptions* for the list of available options).

Returns The path to compiled game.

```
textworld.generator.make_game(options)
```

Make a game (map + objects + quest).

Parameters **options** (*GameOptions*) – For customizing the game generation (see *textworld.GameOptions* for the list of available options).

Return type *Game*

Returns Generated game.

```
textworld.generator.make_game_with(world, quests=None, grammar=None)
```

```
textworld.generator.make_grammar(options={}, rng=None)
```

Return type *Grammar*

```
textworld.generator.make_map(n_rooms, size=None, rng=None, possible_door_states=['open', 'closed', 'locked'])
```

Make a map.

Parameters

- **n_rooms** (*int*) – Number of rooms in the map.
- **size** (*tuple of int*) – Size (height, width) of the grid delimiting the map.

```
textworld.generator.make_quest(world, options=None)
```

```
textworld.generator.make_small_map(n_rooms, rng=None, possible_door_states=['open', 'closed', 'locked'])
```

Make a small map.

The map will contains one room that connects to all others.

Parameters

- **n_rooms** (*int*) – Number of rooms in the map (maximum of 5 rooms).
- **possible_door_states** (*list of str, optional*) – Possible states doors can have.

`textworld.generator.make_world(world_size, nb_objects=0, rngs=None)`
Make a world (map + objects).

Parameters

- **world_size** (*int*) – Number of rooms in the world.
- **nb_objects** (*int*) – Number of objects in the world.

`textworld.generator.make_world_with.rooms(rng=None)`
Make a world that contains the given rooms.

Parameters **rooms** (*list of textworld.logic.Variable*) – Rooms in the map. Variables must have type ‘r’.

exception `textworld.generator.chaining.QuestGenerationError`
Bases: `Exception`

class `textworld.generator.chaining.Chain(initial_state, nodes)`
Bases: `object`

An initial state and a chain of actions forming a quest.

nodes

The dependency tree of this quest.

initial_state

The initial state from which the actions start.

actions

The sequence of actions forming this quest.

class `textworld.generator.chaining.ChainNode(action, depth, breadth, parent)`
Bases: `object`

A node in a chain of actions.

action

The action to perform at this step.

depth

This node’s depth in the dependency tree.

breadth

This node’s breadth in the dependency tree.

parent

This node’s parent in the dependency tree.

class `textworld.generator.chaining.ChainingOptions`
Bases: `object`

Options for customizing the behaviour of chaining.

backward

Whether to run chaining forwards or backwards. Forward chaining produces a sequence of actions that start at the provided state, while backward chaining produces a sequence of actions that end up at the provided state.

min_length

The minimum length of the generated quests.

max_length

The maximum length of the generated quests.

min_depth

The minimum depth (length) of the generated independent subquests.

max_depth

The maximum depth (length) of the generated independent subquests.

min_breadth

The minimum breadth of the generated quests. When this is higher than 1, the generated quests will have multiple parallel subquests. In this case, min_depth and max_depth limit the length of these independent subquests, not the total size of the quest.

max_breadth

The maximum breadth of the generated quests.

subquests

Whether to also return incomplete quests, which could be extended without reaching the depth or breadth limits.

independent_chains

Whether to allow totally independent parallel chains.

create_variables

Whether new variables may be created during chaining.

fixed_mapping

A fixed mapping from placeholders to variables, for singletons.

rng

If provided, randomize the order of the quests using this random number generator.

logic

The rules of the game.

rules_per_depth

A list of lists of rules for restricting the allowed actions at certain depths.

restricted_types

A set of types that may not have new variables created.

allowed_types

A set of types that are allowed to have new variables created.

check_action(state, action)

Check if an action should be allowed in this state.

The default implementation disallows actions that would create new facts that don't mention any new variables.

Parameters

- **state** ([State](#)) – The current state.
- **action** ([Action](#)) – The action being applied.

Return type bool

Returns Whether that action should be allowed.

check_new_variable(state, type, count)

Check if a new variable should be allowed to be created in this state.

Parameters

- **state** ([State](#)) – The current state.
- **type** (str) – The type of variable being created.
- **count** (int) – The total number of variables of that type.

Return type bool

Returns Whether that variable should be allowed to be created.

copy()

Return type [ChainingOptions](#)

get_rules(depth)

Get the relevant rules for this depth.

Parameters **depth** (int) – The current depth in the chain.

Return type Iterable[[Rule](#)]

Returns The rules that may be applied at this depth in the chain.

property fixed_mapping: [textworld.logic.GameLogic](#)

Return type [GameLogic](#)

property logic: [textworld.logic.GameLogic](#)

Return type [GameLogic](#)

textworld.generator.chaining.get_chains(state, options)

Generates chains of actions (quests) starting from or ending at the given state.

Parameters

- **state** ([State](#)) – The initial state for chaining.
- **options** ([ChainingOptions](#)) – Options to configure chaining behaviour.

Return type Iterable[[Chain](#)]

Returns All possible quests according to the constraints.

textworld.generator.chaining.sample_quest(state, options)

Samples a single chain of actions (a quest) starting from or ending at the given state.

Parameters

- **state** ([State](#)) – The initial state for chaining.
- **options** ([ChainingOptions](#)) – Options to configure chaining behaviour. Set options.rng to sample a random quest.

Return type Optional[[Chain](#)]

Returns A single possible quest.

Raises [QuestGenerationError](#) – No quest could be generated given the provided chaining options.

class textworld.generator.dependency_tree.DependencyTree(element_type=<class

'textworld.generator.dependency_tree.DependencyTreeElement'
trees=[])

Bases: object

copy()

Return type `DependencyTree`

push(*value*, *allow_multi_root=False*)

Add a value to this dependency tree.

Adding a value already present in the tree does not modify the tree.

Parameters

- **value** (Any) – value to add.

- **allow_multi_root** (bool) – if True, allow the value to spawn an additional root if needed.

Return type bool

remove(*value*)

Remove all leaves having the given value.

The value to remove needs to belong to at least one leaf in this tree. Otherwise, the tree remains unchanged.

Parameters **value** (Any) – value to remove from the tree.

Return type bool

Returns Whether the tree has changed or not.

property empty: bool

Return type bool

property leaves_elements:

`List[textworld.generator.dependency_tree.DependencyTreeElement]`

Return type List[`DependencyTreeElement`]

property leaves_values: List[Any]

Return type List[Any]

property values: List[Any]

Return type List[Any]

class `textworld.generator.dependency_tree.DependencyTreeElement`(*value*)

Bases: object

Representation of an element in the dependency tree.

The notion of dependency and ordering should be defined for these elements.

Subclasses should override `depends_on`, `__lt__` and `__str__` accordingly.

depends_on(*other*)

Check whether this element depends on the other.

Return type bool

is_distinct_from(*others*)

Check whether this element is distinct from others.

Return type bool

class `textworld.generator.logger.GameLogger`(*group_actions=True*)

Bases: object

aggregate(*other*)

collect(*game*)

```
display_stats()
static load(filename)
save(filename)
stats()

exception textworld.generator.vtypes.NotEnoughNounsError
    Bases: NameError

class textworld.generator.vtypes.VariableType(type, name, parent=None)
    Bases: object

    classmethod deserialize(data)

        Return type VariableType

    classmethod parse(expr)
        Parse a variable type expression.

        Parameters expr (str) – The string to parse, in the form name: type -> parent1 &
        parent2 or name: type for root node.

        Return type VariableType

    serialize()

        Return type str

class textworld.generator.vtypes.VariableTypeTree(vtypes)
    Bases: object

    Manages hierarchy of types defined in ./grammars/variables.txt. Used for extending the rules.

    count(state)
        Counts how many objects there are of each type.

    descendants(vtype)
        Given a variable type, return all possible descendants.

    classmethod deserialize(data)

        Return type VariableTypeTree

    get_ancestors(vtype)
        List all ancestors of a type where the closest ancestors are first.

    get_description(vtype)
    is_constant(vtype)
    is_descendant_of(child, parents)
        Return if child is a descendant of parent

    classmethod load(path)
        Read variables from text file.

    sample(parent_type, rng, exceptions=[], include_parent=True, probs=None)
        Sample an object type given the parent's type.

    serialize()
```

Return type List

```
CHEST = 'c'
CLASS HOLDER = ['c', 's']
SUPPORTER = 's'

textworld.generator.vtypes.get_new(type, types_counts, max_types_counts=None)
    Get the next available id for a given type.

textworld.generator.vtypes.parse_variable_types(content)
    Parse a list VariableType expressions.
```

11.1 Game

```
exception textworld.generator.game.UnderspecifiedEventError
    Bases: NameError

exception textworld.generator.game.UnderspecifiedQuestError
    Bases: NameError

class textworld.generator.game.ActionDependencyTree(*args, kb=None, **kwargs)
    Bases: textworld.generator.dependency_tree.DependencyTree
        copy()
```

Return type ActionDependencyTree

flatten()

Generates a flatten representation of this dependency tree.

Actions are greedily yielded by iteratively popping leaves from the dependency tree.

Return type Iterable[Action]

remove(action)

Remove all leaves having the given value.

The value to remove needs to belong to at least one leaf in this tree. Otherwise, the tree remains unchanged.

Parameters value – value to remove from the tree.

Return type Tuple[bool, Optional[Action]]

Returns Whether the tree has changed or not.

```
class textworld.generator.game.ActionDependencyTreeElement(value)
    Bases: textworld.generator.dependency_tree.DependencyTreeElement
```

Representation of an Action in the dependency tree.

The notion of dependency and ordering is defined as follows:

- action1 depends on action2 if action1 needs the propositions added by action2;
- action1 should be performed before action2 if action2 removes propositions needed by action1.

depends_on(other)

Check whether this action depends on the other.

Action1 depends on action2 when the intersection between the propositions added by action2 and the pre-conditions of the action1 is not empty, i.e. action1 needs the propositions added by action2.

Return type bool

is_distinct_from(others)
Check whether this element is distinct from others.

We check if self.action has any additional information that others actions don't have. This helps us to identify whether a group of nodes in the dependency tree already contain all the needed information that self.action would bring.

Return type bool

property action: `textworld.logic.Action`

Return type `Action`

class `textworld.generator.game.EntityInfo(id, type)`
Bases: object

Additional information about entities in the game.

classmethod deserialize(data)
Creates a `EntityInfo` from serialized data.

Parameters `data` (Mapping) – Serialized data with the needed information to build a `EntityInfo` object.

Return type `EntityInfo`

serialize()
Serialize this object.

Results: EntityInfo's data serialized to be JSON compatible

Return type Mapping

adj
The adjective (i.e. descriptive) part of the name, if available.

Type str

definite
The definite article to use for this entity.

Type str

desc
Text description displayed when examining this entity in the game.

Type str

id
Unique name for this entity. It is used when generating

Type str

indefinite
The indefinite article to use for this entity.

Type str

name
The name that will be displayed in-game to identify this entity.

Type str

noun

The noun part of the name, if available.

Type str

room_type

Type of the room this entity belongs to. It used to influence its *name* during text generation.

Type str

synonyms

Alternative names that can be used to refer to this entity.

Type List[str]

type

The type of this entity.

Type str

class textworld.generator.game.**Event**(*actions*=(), *conditions*=(), *commands*=())

Bases: object

Event happening in TextWorld.

An event gets triggered when its set of conditions become all satisfied.

actions

Actions to be performed to trigger this event

commands

Human readable version of the actions.

condition

textworld.logic.Action that can only be applied when all conditions are satisfied.

Parameters

- **actions** (Iterable[*Action*]) – The actions to be performed to trigger this event. If an empty list, then **conditions** must be provided.
- **conditions** (Iterable[*Proposition*]) – Set of propositions which need to be all true in order for this event to get triggered.
- **commands** (Iterable[str]) – Human readable version of the actions.

copy()

Copy this event.

Return type *Event*

classmethod deserialize(*data*)

Creates an *Event* from serialized data.

Parameters **data** (Mapping) – Serialized data with the needed information to build a *Event* object.

Return type *Event*

is_triggering(*state*)

Check if this event would be triggered in a given state.

Return type bool

serialize()

Serialize this event.

Results: *Event*'s data serialized to be JSON compatible.

Return type Mapping

set_conditions(*conditions*)

Set the triggering conditions for this event.

Parameters **conditions** (Iterable[*Proposition*]) – Set of propositions which need to be all true in order for this event to get triggered.

Return type Action

Returns Action that can only be applied when all conditions are satisfied.

property actions: Iterable[*textworld.logic.Action*]

Return type Iterable[*Action*]

property commands: Iterable[str]

Return type Iterable[str]

class textworld.generator.game.EventProgression(*event, kb*)

Bases: object

EventProgression monitors a particular event.

Internally, the event is represented as a dependency tree of relevant actions to be performed.

Parameters **quest** – The quest to keep track of its completion.

compress_policy(*state*)

Compress the policy given a game state.

Parameters **state** (*State*) – Current game state.

Return type bool

Returns Whether the policy was compressed or not.

copy()

Return a soft copy.

Return type EventProgression

update(*action=None, state=None*)

Update event progression given available information.

Parameters

- **action** (Optional[*Action*]) – Action potentially affecting the event progression.
- **state** (Optional[*State*]) – Current game state.

Return type None

property done: bool

Check if the quest is done (i.e. triggered or untriggerable).

Return type bool

property triggered: bool

Check whether the event has been triggered.

Return type bool

property triggering_policy: List[[textworld.logic.Action](#)]

Actions to be performed in order to trigger the event.

Return type List[[Action](#)]

property untriggerable: bool

Check whether the event is in an untriggerable state.

Return type bool

class [textworld.generator.game.Game](#)(*world*, *grammar=None*, *quests=()*)

Bases: object

Game representation in TextWorld.

A [Game](#) is defined by a world and it can have quest(s) or not. Additionally, a grammar can be provided to control the text generation.

Parameters

- **world** ([World](#)) – The world to use for the game.
- **quests** (Iterable[[Quest](#)]) – The quests to be done in the game.
- **grammar** (Optional[[Grammar](#)]) – The grammar to control the text generation.

change_grammar(*grammar*)

Changes the grammar used and regenerate all text.

Return type None

copy()

Make a shallow copy of this game.

Return type [Game](#)

classmethod deserialize(*data*)

Creates a [Game](#) from serialized data.

Parameters **data** (Mapping) – Serialized data with the needed information to build a [Game](#) object.

Return type [Game](#)

classmethod load(*filename*)

Creates [Game](#) from serialized data saved in a file.

Return type [Game](#)

save(*filename*)

Saves the serialized data of this game to a file.

Return type None

serialize()

Serialize this object.

Results: Game's data serialized to be JSON compatible

Return type Mapping

property command_templates: List[str]

All command templates understood in this game.

```
    Return type List[str]
property directions_names: List[str]
    Return type List[str]
property entity_names: List[str]
    Return type List[str]
property infos: Dict[str, textworld.generator.game.EntityInfo]
    Information about the entities in the game.
    Return type Dict[str, EntityInfo]
property max_score: int
    Sum of the reward of all quests.
    Return type int
property objective: str
    Return type str
property objects_names: List[str]
    The names of all relevant objects in this game.
    Return type List[str]
property objects_names_and_types: List[str]
    The names of all non-player objects along with their type in this game.
    Return type List[str]
property objects_types: List[str]
    All types of objects in this game.
    Return type List[str]
property verbs: List[str]
    Verbs that should be recognized in this game.
    Return type List[str]
property walkthrough: Optional[List[str]]
    Return type Optional[List[str]]
property win_condition: List[Collection[textworld.logic.Proposition]]
    All win conditions, one for each quest.
    Return type List[Collection[Proposition]]
class textworld.generator.game.GameOptions
    Bases: object
    Options for customizing the game generation.
nb_rooms
    Number of rooms in the game.
    Type int
nb_objects
    Number of objects in the game.
    Type int
```

nb_parallel_quests

Number of parallel quests, i.e. not sharing a common goal.

Type int

quest_length

Number of actions that need to be performed to complete the game.

Type int

quest_breadth

Number of subquests per independent quest. It controls how nonlinear a quest can be (1: linear).

Type int

quest_depth

Number of actions that need to be performed to solve a subquest.

Type int

path

Path of the compiled game (.ulx or .z8). Also, the source (.ni) and metadata (.json) files will be saved along with it.

Type str

force_recompile

If True, recompile game even if it already exists.

Type bool

file_ext

Type of the generated game file. Either .z8 (Z-Machine) or .ulx (Glulx). If [path](#) already has an extension, this is ignored.

Type str

seeds

Seeds for the different generation processes.

- If None, seeds will be sampled from [textworld.g_rng](#).
- If int, it acts as a seed for a random generator that will be used to sample the other seeds.
- If dict, the following keys can be set:
 - 'map': control the map generation;
 - 'objects': control the type of objects and their location;
 - 'quest': control the quest generation;
 - 'grammar': control the text generation.

For any key missing, a random number gets assigned (sampled from [textworld.g_rng](#)).

Type Optional[Union[int, Dict]]

kb

The knowledge base containing the logic and the text grammars (see [textworld.generator.KnowledgeBase](#) for more information).

Type [KnowledgeBase](#)

chaining

For customizing the quest generation (see `textworld.generator.ChainingOptions` for the list of available options).

Type `ChainingOptions`

grammar

For customizing the text generation (see `textworld.generator.GrammarOptions` for the list of available options).

Type `GrammarOptions`

copy()

Return type `GameOptions`

property `kb: textworld.generator.data.KnowledgeBase`

Return type `KnowledgeBase`

property `quest_breadth: int`

Return type `int`

property `quest_length: int`

Return type `int`

property `rngs: Dict[str, numpy.random.mtrand.RandomState]`

Return type `Dict[str, RandomState]`

property `seeds`

property `uuid: str`

Return type `str`

class `textworld.generator.game.GameProgression(game, track_quests=True)`

Bases: `object`

GameProgression keeps track of the progression of a game.

If `tracking_quests` is True, then `winning_policy` will be the list of Action that need to be applied in order to complete the game.

Parameters

- `game` (`Game`) – The game for which to track progression.
- `track_quests` (`bool`) – whether quest progressions are being tracked.

copy()

Return a soft copy.

Return type `GameProgression`

update(`action`)

Update the state of the game given the provided action.

Parameters `action` (`Action`) – Action affecting the state of the game.

Return type `None`

property `completed: bool`

Whether all quests are completed.

Return type bool

property done: bool

Whether all quests are completed or at least one has failed or is unfinished.

Return type bool

property failed: bool

Whether at least one quest has failed or is unfinished.

Return type bool

property score: int

Sum of the reward of all completed quests.

Return type int

property tracking_quests: bool

Whether quests are being tracked or not.

Return type bool

property valid_actions: List[*textworld.logic.Action*]

Actions that are valid at the current state.

Return type List[*Action*]

property winning_policy: Optional[List[*textworld.logic.Action*]]

Actions to be performed in order to complete the game.

Return type Optional[List[*Action*]]

Returns A policy that leads to winning the game. It can be None if *tracking_quests* is False or the quest has failed.

```
class textworld.generator.game.Quest(win_events=(), fail_events=(), reward=None, desc=None, commands=())
```

Bases: object

Quest representation in TextWorld.

A quest is defined by a mutually exclusive set of winning events and a mutually exclusive set of failing events.

win_events

Mutually exclusive set of winning events. That is, only one such event needs to be triggered in order to complete this quest.

fail_events

Mutually exclusive set of failing events. That is, only one such event needs to be triggered in order to fail this quest.

reward

Reward given for completing this quest.

desc

A text description of the quest.

commands

List of text commands leading to this quest completion.

Parameters

- **win_events** (Iterable[*Event*]) – Mutually exclusive set of winning events. That is, only one such event needs to be triggered in order to complete this quest.

- **fail_events** (Iterable[*Event*]) – Mutually exclusive set of failing events. That is, only one such event needs to be triggered in order to fail this quest.
- **reward** (Optional[int]) – Reward given for completing this quest. By default, reward is set to 1 if there is at least one winning events otherwise it is set to 0.
- **desc** (Optional[str]) – A text description of the quest.
- **commands** (Iterable[str]) – List of text commands leading to this quest completion.

`copy()`

Copy this quest.

Return type *Quest*

`classmethod deserialize(data)`

Creates a *Quest* from serialized data.

Parameters **data** (Mapping) – Serialized data with the needed information to build a *Quest* object.

Return type *Quest*

`is_failing(state)`

Check if this quest is failing in that particular state.

Return type bool

`is_winning(state)`

Check if this quest is winning in that particular state.

Return type bool

`serialize()`

Serialize this quest.

Results: Quest's data serialized to be JSON compatible

Return type Mapping

`property commands: Iterable[str]`

Return type Iterable[str]

`property fail_events: Iterable[textworld.generator.game.Event]`

Return type Iterable[*Event*]

`property win_events: Iterable[textworld.generator.game.Event]`

Return type Iterable[*Event*]

`class textworld.generator.game.QuestProgression(quest, kb)`

Bases: object

QuestProgression keeps track of the completion of a quest.

Internally, the quest is represented as a dependency tree of relevant actions to be performed.

Parameters **quest** (*Quest*) – The quest to keep track of its completion.

`copy()`

Return a soft copy.

Return type *QuestProgression*

update(*action=None*, *state=None*)

Update quest progression given available information.

Parameters

- **action** (Optional[*Action*]) – Action potentially affecting the quest progression.
- **state** (Optional[*State*]) – Current game state.

Return type None**property completable: bool**

Check if the quest has winning events.

Return type bool**property completed: bool**

Check whether the quest is completed.

Return type bool**property done: bool**

Check if the quest is done (i.e. completed, failed or unfinishable).

Return type bool**property failed: bool**

Check whether the quest has failed.

Return type bool**property unfinishable: bool**

Check whether the quest is in an unfinishable state.

Return type bool**property winning_policy: Optional[List[*textworld.logic.Action*]]**

Actions to be performed in order to complete the quest.

Return type Optional[List[*Action*]]

textworld.generator.game.gen_commands_from_actions(*actions*, *kb=None*)

Return type List[str]

11.2 World

exception *textworld.generator.world.NoFreeExitError*

Bases: Exception

class *textworld.generator.world.World*(*kb=None*)

Bases: object

add_fact(*fact*)**Return type** None**add_facts**(*facts*)**Return type** None

classmethod `deserialize(serialized_facts, kb=None)`

Return type `World`

find_object_by_id(id)

Return type `Optional[WorldObject]`

find_room_by_id(id)

Return type `Optional[WorldRoom]`

classmethod `from_facts(facts, kb=None)`

Return type `World`

classmethod `from_map(map, kb=None)`

Parameters `map` (`Graph`) – Graph defining the structure of the world.

Return type `World`

get_all_objects_in(obj)

Return type `List[WorldObject]`

get_entities_per_type(type)

Get all entities of a certain type.

Return type `List[WorldEntity]`

get_facts_in_scope()

Return type `List[Proposition]`

get_objects_in_inventory()

Return type `List[WorldObject]`

get_visible_objects_in(obj)

Return type `List[WorldObject]`

populate(nb_objects, rng=None, object_types_probs=None)

Return type `List[Proposition]`

populate_room(nb_objects, room, rng=None, object_types_probs=None)

Return type `List[Proposition]`

populate_room_with(objects, room, rng=None)

Return type `List[Proposition]`

```

populate_with(objects, rng=None)

    Return type List[Proposition]

serialize()

    Return type List

set_player_room(start_room=None)

    Return type Proposition

property entities: ValuesView[textworld.generator.world.WorldEntity]

    Return type ValuesView[WorldEntity]

property facts: List[textworld.logic.Proposition]

    Return type List[Proposition]

property objects: List[textworld.generator.world.WorldObject]

    Return type List[WorldObject]

property player_room: textworld.generator.world.WorldRoom

    Return type WorldRoom

property rooms: List[textworld.generator.world.WorldRoom]

    Return type List[WorldRoom]

property state: textworld.logic.State

    Return type State

class textworld.generator.world.WorldEntity(*args, **kwargs)
Bases: textworld.logic.Variable

A WorldEntity is an abstract concept representing anything with a name and a type.

Create a Variable.

Parameters

- name – The (unique) name of the variable.
- type (optional) – The type of the variable. Defaults to the same as the name.

add_related_fact(fact)

    Return type None

classmethod create(var)

    Return type Union[WorldRoom, WorldObject]

get_attributes()

    Return type List[Proposition]

property id: str

```

Return type str

name

type

class textworld.generator.world.**WorldObject**(*args, **kwargs)

Bases: *textworld.generator.world.WorldEntity*

A WorldObject is anything we can directly interact with.

Create a Variable.

Parameters

- **name** – The (unique) name of the variable.
- **type (optional)** – The type of the variable. Defaults to the same as the name.

name

type

class textworld.generator.world.**WorldRoom**(*args, **kwargs)

Bases: *textworld.generator.world.WorldEntity*

WorldRooms can be linked with each other through exits.

Create a Variable.

Parameters

- **name** – The (unique) name of the variable.
- **type (optional)** – The type of the variable. Defaults to the same as the name.

name

type

textworld.generator.world.connect(room1, direction, room2, door=None)

Generate predicates that connect two rooms.

Parameters

- **room1** (*Variable*) – A room variable.
- **direction** (str) – Direction that we need to travel to go from room1 to room2.
- **room2** (*Variable*) – A room variable.
- **door** (Optional[*Variable*]) – The door separating the two rooms. If None, there is no door between the rooms.

Return type List[*Proposition*]

textworld.generator.world.graph2state(G, rooms)

Convert Graph object to a list of Proposition.

Parameters

- **G** (Graph) – Graph defining the structure of the world.
- **rooms** (Dict[str, *Variable*]) – information about the rooms in the world.

Return type List[*Proposition*]

textworld.generator.graph_networks.create_map(rng, n_nodes, h, w, possible_door_states=['open', 'closed', 'locked'])

```

textworld.generator.graph_networks.create_small_map(rng, n_rooms, possible_door_states=['open',
                                         'closed', 'locked'])

textworld.generator.graph_networks.direction(x, y)

textworld.generator.graph_networks.extremes(G)
    Find left most and bottom nodes in the cartesian sense.

textworld.generator.graph_networks.gen_layout(rng, n_nodes=5, h=10, w=10)
    Generate a map with n_nodes rooms by picking a subgraph from a h,w grid.

textworld.generator.graph_networks.get_path(G, room1, room2)

textworld.generator.graph_networks.mark_doors(G, rng, possible_door_states=['open', 'closed', 'locked'])
    Put doors between neighbouring articulation points.

textworld.generator.graph_networks.plot_graph(G, show=True)
    Plot TextWorld's graph representation of a world.

Return type None

textworld.generator.graph_networks.relabel(G)
    Relabel G so that its origin is (0, 0)

textworld.generator.graph_networks.reverse_direction(direction)

textworld.generator.graph_networks.shortest_path(G, source, target)
    Return shortest path in terms of directions.

textworld.generator.graph_networks.xy_diff(x, y)

```

11.3 GameMaker

```

exception textworld.generator.maker.ExitAlreadyUsedError
    Bases: ValueError

exception textworld.generator.maker.FailedConstraintsError(failed_constraints)
    Bases: ValueError
    Thrown when a constraint has failed during generation.

    Parameters failed_constraints (List[Action]) – The constraints that have failed

exception textworld.generator.maker.MissingPlayerError
    Bases: ValueError

exception textworld.generator.maker.PlayerAlreadySetError
    Bases: ValueError

exception textworld.generator.maker.QuestError
    Bases: ValueError

class textworld.generator.maker.GameMaker(options=None)
    Bases: object

    Stateful utility class for handcrafting text-based games.

player
    Entity representing the player.

    Type WorldEntity

```

inventory

Entity representing the player's inventory.

Type `WorldEntity`

nowhere

List of out-of-world entities (e.g. objects that would only appear later in a game).

Type `List[WorldEntity]`

rooms

The rooms present in this world.

Type `List[WorldRoom]`

paths

The connections between the rooms.

Type `List[WorldPath]`

Creates an empty world, with a player and an empty inventory.

add_fact(*name*, **entities*)

Adds a fact.

Parameters

- **name** (`str`) – The name of the new fact.
- ***entities** – A list of `WorldEntity` as arguments to this fact.

Return type `None`

build(*validate=True*)

Create a Game instance given the defined facts.

Parameters validate (*optional*) – If True, check if the game is valid, i.e. respects all constraints.

Returns

Return type Generated game.

compile(*path*)

Compile this game.

Parameters path (`str`) – Path where to save the generated game.

Returns Path to the game file.

Return type `game_file`

connect(*exit1*, *exit2*)

Connect two rooms using their exits.

Parameters

- **exit1** (`WorldRoomExit`) – The exit of the first room to link.
- **exit2** (`WorldRoomExit`) – The exit of the second room to link.

Return type `WorldPath`

Returns The path created by the link between two rooms, with no door.

find_by_name(*name*)

Find an entity using its name.

Return type `Optional[WorldEntity]`

find_path(*room1*, *room2*)

Get the path between two rooms, if it exists.

Parameters

- **room1** (`WorldRoom`) – One of the two rooms.
- **room2** (`WorldRoom`) – The other room.

Return type `Optional[WorldEntity]`

Returns The matching path path, if it exists.

findall(*type*)

Gets all entities of the given type.

Parameters **type** (`str`) – The type of entity to find.

Return type `List[WorldEntity]`

Returns All entities which match.

generate_distractors(*nb_distractors*)

Generates a number of distractors - random objects.

Parameters **nb_distractors** (`int`) – The number of distractors to game will contain.

Return type `None`

generate_random_quests(*nb_quests=1*, *length=1*, *breadth=1*)

Generates random quests for the game.

Warning: This method overrides any previous quests the game had.

Parameters

- **nb_quests** – Number of parallel quests, i.e. not sharing a common goal.
- **length** (`int`) – Number of actions that need to be performed to complete the game.
- **breadth** (`int`) – Number of subquests per independent quest. It controls how nonlinear a quest can be (1: linear).

Return type `List[Quest]`

Returns The generated quests.

import_graph(*G*)

Convert Graph object to a list of Proposition.

Parameters **G** (`Graph`) – Graph defining the structure of the world.

Return type `List[WorldRoom]`

move(*entity*, *new_location*)

Move an entity to a new location.

Parameters

- **entity** (`WorldEntity`) – Entity to move.
- **new_location** (`WorldEntity`) – Where to move the entity.

Return type None

new(*type*, *name*=None, *desc*=None)
Creates new entity given its type.

Parameters

- **type** (str) – The type of the entity.
- **name** (Optional[str]) – The name of the entity.
- **desc** (Optional[str]) – The description of the entity.

Return type Union[*WorldEntity*, *WorldRoom*]

Returns

The newly created entity.

- If the **type** is 'r', then a *WorldRoom* object is returned.
- Otherwise, a *WorldEntity* is returned.

new_door(*path*, *name*=None, *desc*=None)

Creates a new door and add it to the path.

Parameters

- **path** (*WorldPath*) – A path between two rooms where to add the door.
- **name** (Optional[str]) – The name of the door. Default: generate one automatically.
- **desc** (Optional[str]) – The description of the door.

Return type *WorldEntity*

Returns The newly created door.

new_event_using_commands(*commands*)

Creates a new event using predefined text commands.

This launches a `textworld.play` session to execute provided commands.

Parameters **commands** (List[str]) – Text commands.

Return type *Event*

Returns The resulting event.

new_fact(*name*, **entities*)

Create new fact.

Parameters

- **name** (str) – The name of the new fact.
- ***entities** – A list of entities as arguments to the new fact.

Return type None

new_quest_using_commands(*commands*)

Creates a new quest using predefined text commands.

This launches a `textworld.play` session to execute provided commands.

Parameters **commands** (List[str]) – Text commands.

Return type *Quest*

Returns The resulting quest.

new_room(*name=None, desc=None*)

Create new room entity.

Parameters

- **name** (Optional[str]) – The name of the room.
- **desc** (Optional[str]) – The description of the room.

Return type *WorldRoom*

Returns The newly created room entity.

record_quest()

Defines the game's quest by recording the commands.

This launches a `textworld.play` session.

Return type *Quest*

Returns The resulting quest.

render(*interactive=False*)

Returns a visual representation of the world. :type interactive: bool :param interactive: opens an interactive session in the browser instead of returning a png. :return: :param save_screenshot: ONLY FOR WHEN interactive == False. Save screenshot in temp directory. :param filename: filename for screenshot

set_player(*room*)

Place the player in room.

Parameters **room** (*WorldRoom*) – The room the player will start in.

Notes

At the moment, the player can only be placed once and cannot be moved once placed.

Raises *PlayerAlreadySetError* – If the player has already been set.

Return type None**set_quest_from_commands**(*commands*)

Defines the game's quest using predefined text commands.

This launches a `textworld.play` session.

Parameters **commands** (List[str]) – Text commands.

Return type *Quest*

Returns The resulting quest.

set_walkthrough(*commands*)**test**(*walkthrough=False*)

Test the game being built.

This launches a `textworld.play` session.

Return type None**validate()**

Check if the world is valid and can be compiled.

A world is valid if the player has been placed in a room and all constraints (defined in the *knowledge base*) are respected.

Return type bool

property facts: Iterable[*textworld.logic.Proposition*]

All the facts associated to the current game state.

Return type Iterable[*Proposition*]

property state: *textworld.logic.State*

Current state of the world.

Return type *State*

class *textworld.generator.maker.WorldEntity*(*var*, *name=None*, *desc=None*, *kb=None*)

Bases: object

Represents an entity in the world.

Example of entities commonly found in text-based games: rooms, doors, items, etc.

Parameters

- **var** (*Variable*) – The underlying variable for the entity which is used by TextWorld’s inference engine.
- **name** (Optional[str]) – The name of the entity that will be displayed in-game. Default: generate one according the variable’s type.
- **desc** (Optional[str]) – The description of the entity that will be displayed when examining it in the game.

add(*entities)

Add children to this entity.

Return type None

add_fact(name, *entities)

Adds a fact to this entity.

Parameters

- **name** (str) – The name of the new fact.
- ***entities** – A list of entities as arguments to the new fact.

Return type None

add_property(name)

Adds a property to this entity.

A property is a fact that only involves one entity. For instance, ‘closed(c)’, ‘open(c)’, and ‘locked(c)’ are all properties.

Parameters **name** (str) – The name of the new property.

Return type None

has_property(name)

Determines if this object has a property with the given name.

Parameters **property.** (*The name of the*) –

Example

```
>>> from textworld import GameMaker
>>> M = GameMaker()
>>> chest = M.new(type="c", name="chest")
>>> chest.has_property('closed')
False
>>> chest.add_property('closed')
>>> chest.has_property('closed')
True
```

Return type bool

remove(*entities)
remove_fact(name, *entities)

Return type None

remove_property(name)

Return type None

property facts: List[*textworld.logic.Proposition*]
All facts related to this entity (or its children content).

Return type List[*Proposition*]

property id: str
Unique name used internally.

Return type str

property name: str
Name of this entity.

Return type str

property properties: List[*textworld.logic.Proposition*]
Properties of this object are things that refer to this object and this object alone. For instance, ‘closed’, ‘open’, and ‘locked’ are possible properties of ‘containers’.

Return type List[*Proposition*]

property type: str
Type of this entity.

Return type str

class *textworld.generator.maker.WorldPath*(*src*, *src_exit*, *dest*, *dest_exit*, *door=None*, *kb=None*)
Bases: object

Represents a path between two *WorldRoom* objects.

A *WorldPath* encapsulates the source *WorldRoom*, the source *WorldRoomExit*, the destination *WorldRoom* and the destination *WorldRoom*. Optionally, a linking door can also be provided.

Parameters

- **src** (*WorldRoom*) – The source room.

- **src_exit** (*WorldRoomExit*) – The exit of the source room.
- **dest** (*WorldRoom*) – The destination room.
- **dest_exit** (*WorldRoomExit*) – The exist of the destination room.
- **door** (Optional[*WorldEntity*]) – The door between the two rooms, if any.

property door: Optional[*textworld.generator.maker.WorldEntity*]

The entity representing the door or None if there is none.

Return type Optional[*WorldEntity*]

property facts: List[*textworld.logic.Proposition*]

Facts related to this path.

Return type List[*Proposition*]

Returns The facts that make up this path.

class *textworld.generator.maker.WorldRoom*(*args, **kwargs)

Bases: *textworld.generator.maker.WorldEntity*

Represents a room in the world.

Takes the same arguments as WorldEntity.

Then, creates a WorldRoomExit for each direction defined in graph_networks.DIRECTIONS, and sets exits to be a dict of those names to the newly created rooms. It then sets an attribute to each name.

Parameters

- **args** – The args to pass to WorldEntity
- **kwargs** – The kwargs to pass to WorldEntity

east

north

south

west

class *textworld.generator.maker.WorldRoomExit*(src, direction, dest=None)

Bases: object

Represents an exit from a Room.

These are used to connect WorldRoom's to form `WorldPath`'s. `WorldRoomExit`'s are linked to each other through their :py:attr:`dest`.

When dest is None, it means there is no path leading to this exit yet.

Parameters

- **src** (*WorldRoom*) – The WorldRoom that the exit is from.
- **direction** (str) – The direction the exit is in: north, east, south, and west are common.
- **dest** (Optional[*WorldRoom*]) – The WorldRoomExit that this exit links to (exits are linked to each other).

textworld.generator.maker.get_failing_constraints(state, kb=None)

11.4 Grammar

```
class textworld.generator.text_generation.CountOrderedDict
    Bases: collections.OrderedDict
        An OrderedDict whose empty items are 0

class textworld.generator.text_generation.MergeAction
    Bases: object
        Group of actions merged into one.
        This allows for blending consecutive instructions.

textworld.generator.text_generation.assign_description_to_object(obj, grammar, game)
    Assign a descriptor to an object.

textworld.generator.text_generation.assign_description_to_quest(quest, game, grammar)
textworld.generator.text_generation.assign_description_to_room(room, game, grammar)
    Assign a descriptor to a room.

textworld.generator.text_generation.assign_name_to_object(obj, grammar, game_infos)
    Assign a name to an object (if needed).

textworld.generator.text_generation.assign_new_matching_names(obj1_infos, obj2_infos, grammar,
    exclude)
textworld.generator.text_generation.clean_replace_objs(grammar, desc, objs, game)
    Return a cleaned/keyword replaced for a list of objects.

textworld.generator.text_generation.describe_event(event, game, grammar)
    Assign a descriptor to a quest.

Return type str

textworld.generator.text_generation.expand_clean_replace(symbol, grammar, obj, game)
    Return a cleaned/keyword replaced symbol.

textworld.generator.text_generation.generate_instruction(action, grammar, game, counts)
    Generate text instruction for a specific action.

textworld.generator.text_generation.generate_text_from_grammar(game, grammar)
textworld.generator.text_generation.get_action_chains(actions, grammar, game)
    Reduce the action list by combining similar actions.

textworld.generator.text_generation.is_seq(chain, game)
    Check if we have a theoretical chain in actions.

textworld.generator.text_generation.list_to_string(lst, det, det_type='a')
    Convert a list to a natural language string.

textworld.generator.text_generation.obj_list_to_prop_string(objs, property, game, det=True,
    det_type='a')
    Convert an object list to a nl string list of names.

textworld.generator.text_generation.repl_sing_plur(phrase, length)
    Alter a sentence depending on whether or not we are dealing with plural or singular objects (for counting)

textworld.generator.text_generation.replace_num(phrase, val)
    Add a numerical value to a string.
```

```
exception textworld.generator.text_grammar.MissingTextGrammar(path)
```

Bases: NameError

```
class textworld.generator.text_grammar.Grammar(options={}, rng=None)
```

Bases: object

Context-Free Grammar for text generation.

Parameters

- **options** (Union[*GrammarOptions*, Mapping[str, Any]]) – For customizing text generation process (see `textworld.generator.GrammarOptions` for the list of available options).
- **rng** (Optional[RandomState]) – Random generator used for sampling tag expansions.

```
check()
```

Check if this grammar is valid.

TODO: use logging mechanism to report warnings and errors.

Return type bool

```
expand(text, rng=None)
```

Expand some text until there is no more tag to expand.

Parameters

- **text** (str) – Text potentially containing grammar tags to be expanded.
- **rng** (optional) – Random generator used to chose an expansion when there is many. By default, it used the random generator of this grammar object.

Returns Resulting text in which there is no grammar tag left to be expanded.

Return type expanded_text

```
generate_name(obj_type, room_type='', include_adj=None, exclude=[])
```

Generate a name given an object type and the type room it belongs to.

Parameters

- **obj_type** (str) – Type of the object for which we will generate a name.
- **room_type** (optional) – Type of the room the object belongs to.
- **include_adj** (optional) – If True, the name can contain a generated adjective. If False, any generated adjective will be discarded. Default: use value `grammar.options.include_adj`
- **exclude** (optional) – List of names we should avoid generating.

Return type Tuple[str, str, str]

Returns

- *name* – The whole name, i.e. adj + " " + noun.
- *adj* – The adjective part of the name.
- *noun* – The noun part of the name.

```
get_all_adjective_for_type(type)
```

Get all possible adjectives for a given object type.

Parameters type (str) – Object type.

Returns All possible adjectives sorted in alphabetical order.

Return type adjectives

get_all_expansions_for_tag(tag, max_depth=500)

Get all possible expansions for a grammar tag.

Parameters

- **tag** (str) – Grammar tag to be expanded.
- **max_depth** (*optional*) – Maximum recursion depth when expanding tag.

Returns All possible expansions.

Return type expansions

get_all_expansions_for_type(type)

Get all possible expansions for a given object type.

Parameters **type** (str) – Object type.

Returns All possible names.

Return type names

get_all_names_for_type(type, include_adj)

Get all possible names for a given object type.

Parameters

- **type** (str) – Object type.
- **include_adj** (*optional*) – If True, names can contain generated adjectives. If False, any generated adjectives will be discarded.

Returns All possible names sorted in alphabetical order.

Return type names

get_all_nouns_for_type(type)

Get all possible nouns for a given object type.

Parameters **type** (str) – Object type.

Returns All possible nouns sorted in alphabetical order.

Return type nouns

get_random_expansion(tag, rng=None)

Return a randomly chosen expansion for the given tag.

Parameters

- **tag** (str) – Grammar tag to be expanded.
- **rng** (*optional*) – Random generator used to chose an expansion when there is many. By default, it used the random generator of this grammar object.

Returns An expansion chosen randomly for the provided tag.

Return type expansion

get_vocabulary()

Return type List[str]

has_tag(tag)

Check if the grammar has a given tag.

Return type bool

split_name_adj_noun(*candidate*, *include_adj*)

Extract the full name, the adjective and the noun from a string.

Parameters

- **candidate** (str) – String that may contain one adjective-noun operator ‘|’.
- **include_adj** (optional) – If True, the name can contain a generated adjective. If False, any generated adjective will be discarded.

Return type Optional[Tuple[str, str, str]]

Returns

- *name* – The whole name, i.e. adj + “ ” + noun.
- *adj* – The adjective part of the name.
- *noun* – The noun part of the name.

class textworld.generator.text_grammar.**GrammarOptions**(*options=None*, ***kwargs*)

Bases: object

copy()

Return type GrammarOptions

classmethod **deserialize**(*data*)

Creates a *GrammarOptions* from serialized data.

Parameters **data** (Mapping) – Serialized data with the needed information to build a *GrammarOptions* object.

Return type GrammarOptions

serialize()

Serialize this object.

Results: GrammarOptions’s data serialized to be JSON compatible.

Return type Mapping

allowed_variables_numbering

Append numbers after an object name if there is not enough variation for it.

Type bool

ambiguous_instructions

When True, in the game objective, objects of interest might be refer to by their type or adjective rather than full name.

Type bool

blend_descriptions

When True, objects sharing some properties might be described in a single sentence rather than separate consecutive ones.

Type bool

blend_instructions

When True, consecutive actions to be accomplished might be described in a single sentence rather than separate ones.

Type bool
include_adj
When True, object names can be preceded by an adjective.

Type bool
names_to_exclude
List of names the text generation should not use.

Type List[str]
only_last_action
When True, only the last action of a quest will be described in the generated objective.

Type bool
theme
Grammar theme's name. All *.twg files starting with that name will be loaded.

Type str
unique_expansion
When True, #symbol# are forced to be expanded to unique text.

Type bool
property uuid: str
Generate UUID for this set of grammar options.

Return type str
textworld.generator.text_grammar.**fix_determinant**(var)

11.5 Knowledge Base

```
class textworld.generator.data.KnowledgeBase(logic, text_grammars_path)
Bases: object

@classmethod def default()
@classmethod deserialize(data)

    Return type KnowledgeBase

get_reverse_action(action)
@classmethod load(target_dir=None)
serialize()

    Return type str

textworld.generator.data.create_data_files(dest='./textworld_data', verbose=False, force=False)
Creates grammar files in the target directory.

Will NOT overwrite files if they already exist (checked on per-file basis).

Parameters
    • dest (str) – The path to the directory where to dump the data files into.
    • verbose (bool) – Print when skipping an existing file.
```

- **force** (bool) – Overwrite all existing files.

11.5.1 Data

container.twl

```
# container

```

define_inform7_kinds()

Generate Inform 7 kind definitions.

Return type str

detect_action(*i7_event, actions*)

Detect which action corresponds to a Inform7 event.

Parameters

- **i7_event** (str) – Inform7 event detected.
- **actions** (Iterable[*Action*]) – List of action to match the Inform7 event against.

Return type Optional[*Action*]

Returns Action corresponding to the provided Inform7 event.

gen_commands_from_actions(*actions*)

Return type List[str]

gen_source(*seed=1234*)

Return type str

gen_source_for_attribute(*attr*)

Return type Optional[str]

gen_source_for_attributes(*attributes*)

Return type str

gen_source_for_conditions(*conds*)

Generate Inform 7 source for winning/losing conditions.

Return type str

```

CHAPTER
TWELVE

TEXTWORLD.CHALLENGES

12.1 Coin Collector

In this type of game, the world consists in a chain of `quest_length` rooms with potentially distractors rooms (i.e. leading to a dead end). The agent starts on one end and has to collect a “coin” object which is placed at the other end. There is no other objects present in the world other than the coin to collect.

12.2 Treasure Hunter

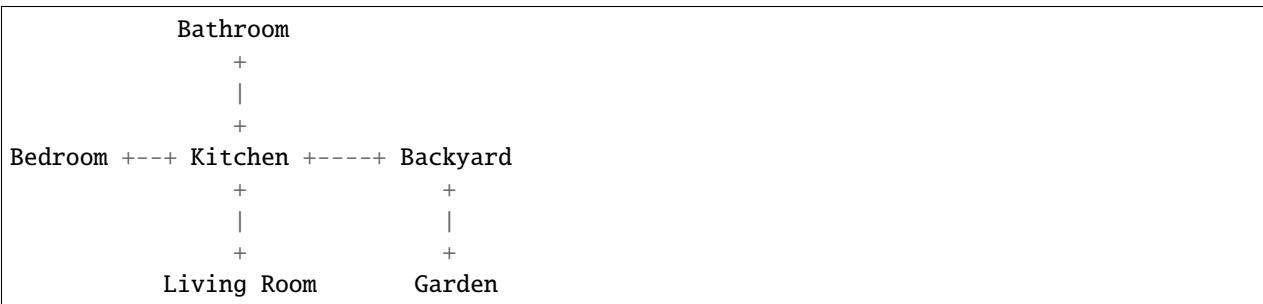

In this type of game, the agent spawns in a randomly generated maze and must find a specific object which is mentioned in the objective displayed when game starts. This is a text version of the task proposed in [Parisotto2017].

References

12.3 A Simple Game

This simple game takes place in a typical house and consists in finding the right food item and cooking it.

Here's the map of the house.

CHAPTER
THIRTEEN

TEXTWORLD.LOGIC

```
class textworld.logic.Action(name, preconditions, postconditions)
Bases: object
```

An action in the environment.

Create an Action.

Parameters

- **name** (str) – The name of this action.
- **preconditions** (Iterable[*Proposition*]) – The preconditions that must hold before this action is applied.
- **postconditions** (Iterable[*Proposition*]) – The conditions that replace the preconditions once applied.

```
classmethod deserialize(data)
```

Return type *Action*

```
format_command(mapping={})
```

```
inverse(name=None)
```

Invert the direction of this action.

Parameters **name** (optional) – The new name for the inverse action.

Returns

Return type An action that does the exact opposite of this one.

```
classmethod parse(expr)
```

Parse an action expression.

Parameters **expr** (str) – The string to parse, in the form name :: [\$]proposition [& [\$]proposition]* -> proposition [& proposition]*.

Return type *Action*

```
serialize()
```

Return type *Mapping*

```
property added: Collection[textworld.logic.Proposition]
```

All the new propositions being introduced by this action.

Return type Collection[*Proposition*]

```
property all_propositions: Collection[textworld.logic.Proposition]
    All the pre- and post-conditions.
```

Return type Collection[*Proposition*]

```
property removed: Collection[textworld.logic.Proposition]
    All the old propositions being removed by this action.
```

Return type Collection[*Proposition*]

property variables

```
class textworld.logic.Alias(pattern, replacement)
    Bases: object
```

A shorthand predicate alias.

expand(*predicate*)

Expand a use of this alias into its replacement.

Return type Collection[*Predicate*]

```
class textworld.logic.GameLogic
    Bases: object
```

The logic for a game (types, rules, etc.).

classmethod deserialize(*data*)

Return type *GameLogic*

classmethod load(*paths*)

normalize_rule(*rule*)

Return type *Rule*

classmethod parse(*cls, document*)

Return type *GameLogic*

serialize()

Return type *str*

```
class textworld.logic.Inform7Command(rule, command, event)
    Bases: object
```

Information about an Inform 7 command.

```
class textworld.logic.Inform7Logic
    Bases: object
```

The Inform 7 bindings of a GameLogic.

```
class textworld.logic.Inform7Predicate(predicate, source)
    Bases: object
```

Information about an Inform 7 predicate.

```
class textworld.logic.Inform7Type(name, kind, definition=None)
    Bases: object
```

Information about an Inform 7 kind.

```
class textworld.logic.Placeholder(name, type=None)
Bases: object
```

A symbolic placeholder for a variable in a Predicate.

Create a Placeholder.

Parameters

- **name** (str) – The name of this placeholder.
- **type** (*optional*) – The type of variable represented. Defaults to the name with any trailing apostrophes stripped.

```
classmethod deserialize(data)
```

Return type *Placeholder*

```
classmethod parse(expr)
```

Parse a placeholder expression.

Parameters **expr** (str) – The string to parse, in the form *name* or *name*: *type*.

Return type *Placeholder*

```
serialize()
```

Return type *Mapping*

name

type

```
class textworld.logic.Predicate(name, parameters)
```

Bases: object

A boolean-valued function over variables.

Create a Predicate.

Parameters

- **name** (str) – The name of this predicate.
- **parameters** (Iterable[*Placeholder*]) – The symbolic arguments to this predicate.

```
classmethod deserialize(data)
```

Return type *Predicate*

```
instantiate(mapping)
```

Instantiate this predicate with the given mapping.

Parameters **mapping** (Mapping[*Placeholder*, *Variable*]) – A mapping from Placeholders to Variables.

Returns

Return type The instantiated Proposition with each Placeholder mapped to the corresponding Variable.

```
match(proposition)
```

Match this predicate against a concrete proposition.

Parameters `proposition` (*Proposition*) – The proposition to match against.

Return type `Optional[Mapping[Placeholder, Variable]]`

Returns

- The mapping from placeholders to variables such that `self.instantiate(mapping) == proposition`, or `None` if no such mapping exists.

classmethod `parse(expr)`

Parse a predicate expression.

Parameters `expr` (`str`) – The string to parse, in the form `name placeholder [, placeholder]*`.

Return type `Predicate`

`serialize()`

Return type `Mapping`

substitute(mapping)

Copy this predicate, substituting certain placeholders for others.

Parameters `mapping` (`Mapping[Placeholder, Placeholder]`) – A mapping from old to new placeholders.

Return type `Predicate`

property names: Collection[str]

The names of the placeholders in this predicate.

Return type `Collection[str]`

property types: Collection[str]

The types of the placeholders in this predicate.

Return type `Collection[str]`

class `textworld.logic.Proposition(name, arguments=[])`

Bases: `mementos.core.NewBase`

An instantiated Predicate, with concrete variables for each placeholder.

Create a Proposition.

Parameters

- `name` (`str`) – The name of the proposition.
- `arguments` (`Iterable[Variable]`) – The variables this proposition is applied to.

classmethod `deserialize(data)`

Return type `Proposition`

classmethod `parse(expr)`

Parse a proposition expression.

Parameters `expr` (`str`) – The string to parse, in the form `name(variable [, variable]*)`.

Return type `Proposition`

serialize()

Return type Mapping

arguments**name**

property names: Collection[str]

The names of the variables in this proposition.

Return type Collection[str]

signature

property types: Collection[str]

The types of the variables in this proposition.

Return type Collection[str]

class textworld.logic.Rule(*name, preconditions, postconditions*)

Bases: object

A template for an action.

Create a Rule.

Parameters

- **name** (str) – The name of this rule.
- **preconditions** (Iterable[Predicate]) – The preconditions that must hold before this rule is applied.
- **postconditions** (Iterable[Predicate]) – The conditions that replace the preconditions once applied.

classmethod deserialize(data)

Return type Rule

instantiate(mapping)

Instantiate this rule with the given mapping.

Parameters mapping (Mapping[Placeholder, Variable]) – A mapping from Placeholders to Variables.

Returns

Return type The instantiated Action with each Placeholder mapped to the corresponding Variable.

inverse(name=None)

Invert the direction of this rule.

Parameters name (optional) – The new name for the inverse rule.

Returns

Return type A rule that does the exact opposite of this one.

match(action)

Match this rule against a concrete action.

Parameters action (Action) – The action to match against.

Return type `Optional[Mapping[Placeholder, Variable]]`

Returns

- The mapping from placeholders to variables such that `self.instantiate(mapping) == action`, or `None` if no such
- *mapping exists.*

classmethod `parse(expr)`

Parse a rule expression.

Parameters `expr` (`str`) – The string to parse, in the form `name :: [$]predicate [& [$]predicate]* -> predicate [& predicate]*.`

Return type `Rule`

serialize()

Return type `Mapping`

substitute(`mapping, name=None`)

Copy this rule, substituting certain placeholders for others.

Parameters `mapping` (`Mapping[Placeholder, Placeholder]`) – A mapping from old to new placeholders.

Return type `Rule`

property `all_predicates: Iterable[textworld.logic.Predicate]`

All the pre- and post-conditions.

Return type `Iterable[Predicate]`

class `textworld.logic.Signature(name, types)`

Bases: `mementos.core.NewBase`

The type signature of a Predicate or Proposition.

Create a Signature.

Parameters

- `name` (`str`) – The name of the proposition/predicate this signature is for.
- `types` (`Iterable[str]`) – The types of the parameters to the proposition/predicate.

classmethod `parse(expr)`

Parse a signature expression.

Parameters `expr` (`str`) – The string to parse, in the form `name(type [, type]*).`

Return type `Signature`

name

types

class `textworld.logic.State(logic, facts=None)`

Bases: `object`

The current state of a world.

Create a State.

Parameters

- **logic** (*GameLogic*) – The logic for this state’s game.
- **facts** (*optional*) – The facts that will be true in this state.

add_fact(*prop*)

Add a fact to the state.

add_facts(*props*)

Add some facts to the state.

all_applicable_actions(*rules*, *mapping=None*)

Get all the rule instantiations that would be valid actions in this state.

Parameters

- **rules** (*Iterable[Rule]*) – The possible rules to instantiate.
- **mapping** (*optional*) – An initial mapping to start from, constraining the possible instantiations.

Returns

Return type The actions that can be instantiated from the given rules in this state.

all_assignments(*rule*, *mapping=None*, *partial=False*, *allow_partial=None*)

Find all possible placeholder assignments that would allow a rule to be instantiated in this state.

Parameters

- **rule** (*Rule*) – The rule to instantiate.
- **mapping** (*optional*) – An initial mapping to start from, constraining the possible instantiations.
- **partial** (*optional*) – Whether incomplete mappings, that would require new variables or propositions, are allowed.
- **allow_partial** (*optional*) – A callback function that returns whether a partial match may involve the given placeholder.

Return type *Iterable[Mapping[Placeholder, Optional[Variable]]]*

Returns

- *The possible mappings for instantiating the rule. Partial mappings requiring new variables will have None in place of existing Variables.*

all_instantiations(*rule*, *mapping=None*)

Find all possible actions that can be instantiated from a rule in this state.

Parameters

- **rule** (*Rule*) – The rule to instantiate.
- **mapping** (*optional*) – An initial mapping to start from, constraining the possible instantiations.

Returns

Return type The actions that can be instantiated from the rule in this state.

apply(*action*)

Apply an action to the state.

Parameters **action** (*Action*) – The action to apply.

Returns

Return type Whether the action could be applied (i.e. whether the preconditions were met)

apply_on_copy(*action*)

Apply an action to a copy of this state.

Parameters *action* ([Action](#)) – The action to apply.

Return type [Optional\[State\]](#)

Returns

- The copied state after the action has been applied or `None` if action
• *wasn't applicable*.

are_facts(*props*)

Returns whether the propositions are all true in this state.

Return type `bool`

copy()

Create a copy of this state.

Return type [State](#)

classmethod deserialize(*data*)

Deserialize a [State](#) object from data.

Return type [State](#)

facts_with_signature(*sig*)

Returns all the known facts with the given signature.

Return type [Set\[Proposition\]](#)

has_variable(*var*)

Returns whether this state is aware of the given variable.

Return type `bool`

is_applicable(*action*)

Check if an action is applicable in this state (i.e. its preconditions are met).

Return type `bool`

is_fact(*prop*)

Returns whether a proposition is true in this state.

Return type `bool`

is_sequence_applicable(*actions*)

Check if a sequence of actions are all applicable in this state.

Return type `bool`

remove_fact(*prop*)

Remove a fact from the state.

remove_facts(*props*)

Remove some facts from the state.

serialize()

Serialize this state.

Return type [Sequence](#)

```
variable_named(name)
    Returns the variable with the given name, if known.

    Return type Variable

variables_of_type(type)
    Returns all the known variables of the given type.

    Return type Set[Variable]

property facts: Iterable[textworld.logic.Proposition]
    All the facts in the current state.

    Return type Iterable[Proposition]

property variables: Iterable[textworld.logic.Variable]
    All the variables tracked by the current state.

    Return type Iterable[Variable]

class textworld.logic.Type(name, parents)
    Bases: object

    A variable type.

    has_subtype_named(name)

        Return type bool

    has_supertype_named(name)

        Return type bool

        is_subtype_of(other)

            Return type bool

            is_supertype_of(other)

                Return type bool

                property ancestors: Iterable[textworld.logic.Type]
                    The ancestors of this type (not including itself).

                    Return type Iterable[Type]

                property child_types: Iterable[textworld.logic.Type]
                    The direct children of this type.

                    Return type Iterable[Type]

                property children: Iterable[str]
                    The names of the direct children of this type.

                    Return type Iterable[str]

                property descendants: Iterable[textworld.logic.Type]
                    The descendants of this type (not including itself).

                    Return type Iterable[Type]

                property parent_types: Iterable[textworld.logic.Type]
                    The parents of this type as Type objects.
```

Return type Iterable[*Type*]

property subtypes: Iterable[*textworld.logic.Type*]
This type and its descendants.

Return type Iterable[*Type*]

property supertypes: Iterable[*textworld.logic.Type*]
This type and its ancestors.

Return type Iterable[*Type*]

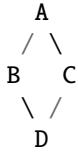

class *textworld.logic.TypeHierarchy*
Bases: object

A hierarchy of types.

add(*type*)

closure(*type*, *expand*)
Compute the transitive closure in a type lattice according to some type relationship (generally direct sub-/super-types).

Such a lattice may look something like this:

so the closure of D would be something like [B, C, A].

Return type Iterable[*Type*]

get(*name*)

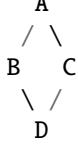

Return type *Type*

multi_ancestors(*types*)
Compute the ancestral closure of a sequence of types. If these are the types of some variables, the result will be all the function parameter types that could also accept those variables.

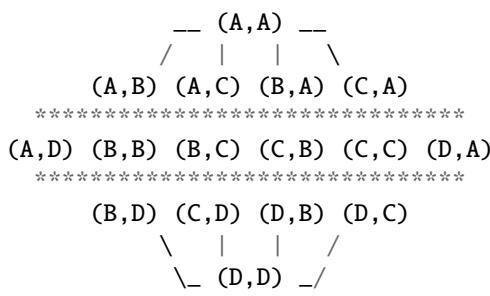

Return type Iterable[Collection[*Type*]]

multi_closure(*types*, *expand*)
Compute the transitive closure of a sequence of types in a type lattice induced by some per-type relationship (generally direct sub-/super-types).

For a single type, such a lattice may look something like this:

so the closure of D would be something like [B, C, A]. For multiple types at once, the lattice is more complicated:

Return type Iterable[Collection[*Type*]]

multi_descendants(*types*)

Compute the descendant closure of a sequence of types. If these are the types of some function parameters, the result will be all the variable types that could also be passed to this function.

Return type Iterable[Collection[*Type*]]

multi_subtypes(*types*)

Computes the descendant closure of a sequence of types, including the initial types.

Return type List[Collection[*Type*]]

multi_supertypes(*types*)

Computes the ancestral closure of a sequence of types, including the initial types.

Return type Iterable[Collection[*Type*]]

class textworld.logic.Variable(*name*, *type=None*)
Bases: object

A variable representing an object in a world.

Create a Variable.

Parameters

- **name** (*str*) – The (unique) name of the variable.
- **type** (*optional*) – The type of the variable. Defaults to the same as the name.

classmethod deserialize(*data*)

Return type Variable

is_a(*type*)

Return type bool

classmethod parse(*expr*)

Parse a variable expression.

Parameters **expr** (*str*) – The string to parse, in the form *name* or *name*: *type*.

Return type Variable

serialize()

Return type Mapping

TEXTWORLD.RENDER

```
exception textworld.render.render.WebdriverNotFoundError
    Bases: Exception

class textworld.render.render.GraphItem(type, name)
    Bases: object

    add_content(content)
    add_unknown_predicate(predicate)
    get_max_depth()
        Returns the maximum nest depth of this plus all children. A container with no items has 1 depth, a container containing one item has 2 depth, a container containing a container which contains an item has 3 depth, and so on. :return: maximum nest depth

    set_open_closed_locked(status)

    to_dict()

    property infos

class textworld.render.render.GraphRoom(name, base_room)
    Bases: object

    add_item(item)
```

Return type None

position_string()

Return type str

```
textworld.render.render.concat_images(*images)
```

```
textworld.render.render.get_webdriver(path=None)
```

Get the driver and options objects. :param path: path to browser binary. :return: driver

```
textworld.render.render.load_state(world, game_infos=None, action=None, format='png',
                                    limit_player_view=False)
```

Generates serialization of game state.

Parameters

- **world** (*World*) – The current state of the world to visualize.
- **game_infos** (Optional[Dict[str, *EntityInfo*]]) – The mapping needed to get objects names.

- **action** (Optional[*Action*]) – If provided, highlight the world changes made by that action.
- **format** (str) – The graph output format (gv, svg, png...)
- **limit_player_view** (bool) – Whether to limit the player's view (defaults to false)

Return type dict

Returns The graph generated from this World

```
textworld.render.render.load_state_from_game_state(game_state, format='png',  
                                                limit_player_view=False)
```

Generates serialization of game state.

Parameters

- **game_state** (*GameState*) – The current game state to visualize.
- **format** (str) – The graph output format (png, svg, pdf, ...)
- **limit_player_view** (bool) – Whether to limit the player's view. Default: False.

Return type dict

Returns The graph generated from this World

```
textworld.render.render.take_screenshot(url, id='world')
```

Takes a screenshot of DOM element given its id. :type url: str :param url: URL of webpage to open headlessly. :type id: str :param id: ID of DOM element. :return: Image object.

```
textworld.render.render.temp_viz(nodes, edges, pos, color=[])
```

```
textworld.render.render.visualize(world, interactive=False)
```

Show the current state of the world. :type world: Union[*Game*, *State*, *GameState*, *World*] :param world: Object representing a game state to be visualized. :type interactive: bool :param interactive: Whether or not to visualize the state in the browser. :return: Image object of the visualization.

```
textworld.render.render.which(program)
```

helper to see if a program is in PATH :param program: name of program :return: path of program or None

Creates server for streamed game state

```
class textworld.render.Server(game_state, port)
```

Bases: object

Visualization server. Uses Server-sent Events to update game_state for visualization.

Note: Flask routes are defined in app.add_url_rule in order to call self in routes. :type game_state: dict :param game_state: game state returned from load_state_from_game_state :type port: int :param port: port to run visualization on

gen()

Our generator for listening for updating state. We poll for results to return us something. If nothing is returned then we just pass and keep polling. :return: yields event-stream parsed data.

index()

Index route (“/”). Returns HTML template processed by handlebars. :rtype: str :return: Flask response object

static listen(conn, results)

Listener for updates. Runs on separate thread. :type conn: Connection :param conn: child connection from multiprocessing.Pipe. :type results: Queue :param results: thread-safe queue for results.

start(child_conn)

Starts the WSGI server and listen for updates on a separate thread.

Parameters `child_conn` (`Connection`) – Child connection from `multiprocessing.Pipe`.

subscribe()
Our Server-sent Event stream route. :return: A stream

update_subscribers(`game_state`)
Updates all subscribers and updates their data. This is for multiple subscribers on the visualization service.
:type game_state: `dict` :param game_state: parsed game_state from `load_state_from_game_state`

class `textworld.render.serve.ServerSentEvent`(`data`)
Bases: `object`
Object helper to parse dict into SSE data. :type data: `any` :param data: data to pass to SSE

encode()

class `textworld.render.serve.SuppressStdStreams`
Bases: `object`
for suppressing std.out streams

class `textworld.render.serve.VisualizationService`(`game_state, open Automatically`)
Bases: `object`
Server for visualization.

We instantiate a new process for our flask server, so our game can send updates to the server. The server instantiates new gevent Queues for every connection.

start(`parent_thread, port`)
Start visualization server on a new process. :type parent_thread: `Thread` :param parent_thread: the parent thread that called start. :type port: `int` :param port: Port to run visualization on.

Return type `None`

start_server(`game_state, port, child_conn`)
function for starting new server on new process. :type game_state: `dict` :param game_state: initial game state from load :type port: `int` :param port: port to run server :type child_conn: `Connection` :param child_conn: child connection from `multiprocessing.Pipe`

stop_server()

update_state(`game_state, command`)
Propogate state update to server. We use a `multiprocessing.Pipe` to pass state into flask process. :type game_state: `GameState` :param game_state: Glux game state. :type command: `str` :param command: previous command

`textworld.render.serve.find_free_port(port_range)`

`textworld.render.serve.get_html_template(game_state=None)`

TEXTWORLD.UTILS

```
class textworld.utils.RandomGenerator(seed=None)
Bases: object
```

Random generator controlling the games generation.

next()

Start a new random generator using a new seed.

set_seed(seed)

property seed

```
class textworld.utils.RegexDict
```

Bases: collections.OrderedDict

Ordered dictionary that supports querying with regex.

References

Adapted from <https://stackoverflow.com/questions/21024822/python-accessing-dictionary-with-wildcards>.

get_matching(*regexes, exclude=[])

Query the dictionary using one or several regular expressions.

Parameters

- ***regexes** – List of regular expressions determining which keys of this dictionary are relevant to this query.
- **exclude** (List[str]) – List of regular expressions determining which keys of this dictionary should be excluded from this query.

Return type List[Any]

Returns The value associated to each relevant (and not excluded) keys.

```
textworld.utils.check_modules(required_modules, missing_modules)
```

Check whether some required modules are missing.

```
textworld.utils.chunk(iterable, n, fct=<function <lambda>>)
```

Return type Iterable[Iterable]

```
textworld.utils.encode_seeds(seeds)
```

Generate UID from a list of seeds.

```
textworld.utils.make_temp_directory(suffix='', prefix='tw_', dir=None)
```

Create temporary folder to used in a with statement.

`textworld.utils.makedirs(dirpath)`

Create all parent folders if needed.

`textworld.utils.save_graph_to_svg(G, labels, filename, backward=False)`

Generate a figure of a networkx's graph object and save it.

`textworld.utils.str2bool(v)`

Convert string to a boolean value. .. rubric:: References

<https://stackoverflow.com/questions/715417/converting-from-a-string-to-boolean-in-python/715468#715468>

`textworld.utils.take(n, iterable)`

Return first n items of the iterable as a list.

References

<https://docs.python.org/3/library/itertools.html#itertools-recipes>

Return type Iterable

`textworld.utils.unique_product(*iterables)`

Cartesian product of input iterables with pruning.

This method prunes any product tuple with duplicate elements in it.

Example

`unique_product('ABC', 'Ax', 'xy')` → Axy BAx BAy Bxy CAx CAy Cxy

Notes

This method is faster than the following equivalent code:

```
>>> for result in itertools.product(*args):
>>>     if len(set(result)) == len(result):
>>>         yield result
```

`textworld.utils.uniqify(seq)`

Order preserving uniqify.

References

Made by Dave Kirby <https://www.peterbe.com/plog/uniqifiers-benchmark>

`textworld.utils.g_rng = <textworld.utils.RandomGenerator object>`

Global random generator.
